Abstract – Bu$_3$SnH-mediated radical cyclization of N-acyl-3-(2-
bromophenyl)-N-ethenypropylamines (14) occurred in an endo-selective manner
to give the 3-benzazocine derivatives (15) in good yields.

INTRODUCTION
In a previous paper, we reported that Bu$_3$SnH-mediated radical cyclization of enamide (1) gave an
isoquinoline derivative (2) as the major product along with a 3-benzazepine derivative (3) in a ratio of 3:1,
and the cyclization of enamide (4) gave exclusively a 3-benzazepine derivative (5) (Scheme 1).† These
results strongly indicated that positional change in the carbonyl group of enamide played an important
role in deciding the course of radical cyclization. When the carbonyl group of starting enamide could be

† This paper is dedicated to Dr. Keiichiro Fukumoto on the occasion of his 75th birthday.
incorporated into the newly formed ring, \textit{exo} radical cyclization predominated (e.g., 1\rightarrow 2), whereas when the carbonyl group was not incorporated into the newly formed ring, \textit{endo} cyclization might result (e.g., 4 \rightarrow 5).  We soon found, however, that \textit{exo}-selectivity of the radical cyclization was lost even when the carbonyl group is incorporated into the newly formed ring.  The radical cyclization of enamide (6) gave a 7-\textit{exo} cyclization product (7) and an 8-\textit{endo} cyclization product (8) in almost equal amounts (Scheme 2), although total yields of the cyclization products were low: the major product was a so-called reduction product (9).²

\textbf{Scheme 2.} Radical cyclization of compound (6).

We then turned our attention to enamides (14), whose radical cyclizations were expected to occur in an 8-\textit{endo}-selective manner, since their carbonyl groups were not incorporated into the newly formed ring.  We describe herein a synthesis of 3-benzazocine derivatives (15) by radical cyclization of enamides (14).³

\textbf{RESULTS AND DISCUSSION}

Scheme 3 shows the synthetic route to the requisite enamides (14).  Amine (12) was obtained by condensation of carboxylic acid (10) with 2-(phenylthio)ethylamine followed by reduction of the carbonyl group of the resulting amide (11) with BH₃.  Acylation of amine (12) with acetyl chloride, pivaloyl chloride, carboxbenzoyl chloride or (Boc)₂O gave amides (13a-d), whose oxidation followed by thermal elimination of the phenylsulfinyl group gave enamides (14a-d) in 68%, 70%, 57% and 62% yields based on amides (13a-d), respectively.

When enamide (14a) was treated with a mixture of \text{Bu}_3\text{SnH} and azobis(cyclohexanecarbonitile) (ACN) (by using the slow addition technique) in boiling toluene, 3-acetyl-3-benzazocine derivative (15a) was obtained in 57% yield along with the reduction product (16a) (30% yield) (Scheme 3).  No 7-\textit{exo} cyclization product was obtained.  Similarly, enamides (14b-d) gave 3-benzazocine derivatives (15b), (15c) and (15d) in 67%, 58% and 63% yields, respectively.  It should be noted that the radical
cyclization of enamides (14a-d) exclusively took place in an *endo*-manner to give 3-benzazocines (15a-d) in good yields.

![Diagram of cyclization process]

We next examined the cyclization of enamides (19a) and (19b) having the methyl or phenyl group at the terminus of the alkenic bond, respectively. Compounds (19a) and (19b) were prepared by condensation of amine (17) and propionaldehyde or phenylacetaldehyde followed by acetylation of the resulting imines (18a) and (18b) with acetyl chloride, respectively (Scheme 4).

Treatment of compound (19a) with Bu₃SnH-ACN in boiling toluene gave 1-methyl-3-benzazocine derivative (20a) and 1-ethyl-2-benzazepine derivative (21a) in 45% and 9% yields, respectively, along with reduction product (22a) in 38% yield (Scheme 4). 7-Exo cyclization product (21a) may arise from a stable intermediate of a methyl-substituted radical. As expected, treatment of phenyl-substituted compound (19b) increased the yield of 7-exo cyclization product (21b), due to the more stable phenyl-substituted radical intermediate. The ratio of the 8-endo cyclization product (20b) and the 7-exo cyclization product (21b) was ca. 1:1.
CONCLUSION

We revealed that Bu₃SnH-mediated radical cyclization of N-acyl-3-(2-bromophenyl)-N-ethenylpropylamines occurred exclusively in an endo-manner to give 3-benzazocine derivatives in good yields. A similar cyclization of a compound having the methyl or phenyl substituent at the terminus of the alkenic bond, however, occurred partially in an exo manner to give 2-benzazepine derivatives.

General Melting points are uncorrected. Infrared (IR) spectra were recorded on a Shimadzu FTIR-8100 spectrophotometer for solutions in CHCl₃. ¹H NMR and ¹³C NMR spectra were measured on a JEOL EX 500 (500 MHz) or a JEOL JNM-EX 270 (270 MHz) spectrometer.
