# (Z)-Selective Enol Triflation of $\alpha$-Alkoxyacetoaldehydes: 

# Application to Synthesis of ( $\boldsymbol{Z}$ )-Allylic Alcohols via Cross-Coupling Reaction and [1,2]-Wittig Rearrangement 

Fumiya Kurosawa, Takeo Nakano, Takahiro Soeta, Kohei Endo, and Yutaka Ukaji*<br>Division of Material Chemistry, Graduate School of Natural Science and Technology, Kanazawa University, Kakuma, Kanazawa, Ishikawa 920-1192<br>E-mail:ukaji@staff.kanazawa-u.ac.jp<br>

#### Abstract

The stereoselective transformation of $\alpha$-alkoxyacetoaldehydes to the corresponding (Z)-vinyl triflates was achieved by treatment with phenyl triflimide and DBU. The stereochemistry was explained by the "syn-effect," which was attributed primarily to an $\sigma \rightarrow \pi^{*}$ interaction. The $\beta$ alkoxy vinyl triflates obtained were applied to the stereoselective synthesis of structurally diverse (Z)-allylic alcohols via transition metal-catalyzed cross-coupling reaction and [1,2]-Wittig rearrangement.

## INTRODUCTION

Stereoselective synthesis of alkenes has been studied extensively. The ( $Z$ )-alkenes, especially, are versatile two-carbon units present in many biologically active compounds and are useful starting materials for chemical transformations, although their preparation is usually more difficult than that for the $E$-isomers. One reason is that $(Z)$-alkenes are generally thermodynamically less stable. ${ }^{1}$

Cross-coupling reaction is quite useful method to prepare alkenes stereospecifically from the corresponding vinyl halides. Vinyl triflates have been also used as synthetic intermediates toward transition metal-mediated cross-coupling reactions in addition to vinyl cation and alkylidene carbene precursors. ${ }^{2,3,4}$ For cross-coupling reactions, stereoselective preparation of ( $Z$ )-vinyl triflates is essential for the subsequent transformation to ( $Z$ )-alkenes. For 1,3-dicarbonyl compounds, $Z$-selective preparation of vinyl triflates was achieved. ${ }^{2 d, 5}$ Chelation-controlled preparation of ( $Z$ )vinyl triflates from $\alpha$-alkoxy ketones also has been reported. ${ }^{6}$ Recently, Cu -catalyzed electrophilic vinyl triflation of alkynes was reported to afford ( $Z$ )-triflates. ${ }^{7}$ For preparation of vinyl triflates from aldehydes, a mixture of $(Z)$ - and $(E)$-vinyl triflates was formed through the use of triflic anhydride ( $\mathrm{Tf}_{2} \mathrm{O}$ ) and 4-methyl-2,6-(di-t-butyl)pyridine (DTBMP). ${ }^{8}$ Alternatively, trimethylsilyl enol ethers could be converted to vinyl triflates by treatment with methyllithium and $\mathrm{Tf}_{2} \mathrm{O},{ }^{9}$ however, ( $Z$ )selective preparation of trimethylsilyl enol ethers from an aldehyde is then an issue. ${ }^{10}$

Previously, a series of isomerization reactions and elimination reactions using a base were performed to investigate the stereochemistry of the isomerized and eliminated products. The results showed that sterically unfavorable $(Z)$-alkenes were formed predominantly. These results were explained by the action of a "syn-effect," ${ }^{11}$ caused primarily by $\sigma \rightarrow \pi^{*}$ interactions. ${ }^{12,13}$ Oxygensubstituted substrates always produced excellent $Z$-selectivities. For example, conformation $\mathbf{T}_{\mathbf{1}}$ was preferred to conformation $\mathbf{T}_{2}$ during deprotonation of $\alpha$-alkoxyacetoaldehyde due to the low donor ability of the C-O bond compared with the C-H bond, affording the corresponding ( $Z$ )-vinyl ethers predominantly as shown in Scheme 1. ${ }^{12 \mathrm{~b}}$

Scheme 1. Transition State Model for Deprotonation of $\alpha$-Alkoxyacetoaldehydes in the Presence of Triisopropylsilyl Triflate $\left(E=\boldsymbol{i}-\mathrm{Pr}_{3} \mathbf{S i}, \mathbf{X}=\mathbf{O T f}\right)^{12 b}$

Furthermore, [1,2]-Wittig rearrangement ${ }^{14}$ of the resulting ( $Z$ )-vinyl ethers proceeded after the initial 1,4-eliminative ring opening reaction of vinyl oxiranes and 1,4-elimination of allylic sulfones and allylic benzoates to give (2Z)-2,4-pentadien-1-ol derivatives in a highly stereoselective manner (Scheme 2). ${ }^{12 \mathrm{c}, 12 e, 12 \mathrm{f}}$ These results demonstrate that the greatest $Z$-selectivity based on the "syneffect" for oxygen-substituted substrates could be applied to stereoselective $\mathrm{C}-\mathrm{C}$ bond formation.

## Scheme 2. Previous Example of Stereoselective Transformation by the Combination of "SynEffect" and [1,2]-Wittig Rearrangement ${ }^{12 f}$

Investigation of isomerization reactions revealed that $\alpha$-alkoxyacetoaldehydes were converted to the corresponding ( $Z$ )- $\beta$-alkoxy silyl enol ethers with excellent $Z$-selectivity. ${ }^{12 \mathrm{~b}, 15}$ Thus, a ( $Z$ )- $\beta$ alkoxy vinyl triflate could be prepared if the enolate is trapped by a triflic-cationic species instead of a silyl cation. In addition, the resulting ( $Z$ )-vinyl triflate should be accompanied by sequential stereoselective $\mathrm{C}-\mathrm{C}$ bond formation via cross-coupling reaction in combination with [1,2]-Wittig rearrangement (Scheme 3). The present report describes the stereoselective enol triflation of $\alpha$ alkoxyacetoaldehydes, followed by cross-coupling reaction and [1,2]-Wittig rearrangement to afford various ( $Z$ )-allylic alcohols stereoselectively.

Scheme 3. Strategy toward Synthesis of (Z)-Allylic Alcohols

## RESULTS AND DISCUSSION

First, the enol triflation reaction of ( $\alpha$-benzyloxy)acetoaldehyde (1A) using triflic anhydride ( $\mathrm{Tf}_{2} \mathrm{O}$ ) (1.2 equiv) and 2,6-di-tert-butyl-4-methylpyridine (DTBMP) was conducted in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ under reflux conditions for $2 \mathrm{~d} .{ }^{8 \mathrm{c}}$ However, very little of the desired vinyl triflate was obtained, while $48 \%$ of $\mathbf{1 A}$
was recovered (Table 1, Entry 1). The desired vinyl triflate also was not obtained when DBU (2.0 equiv) was used as the base in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at rt (Entry 2). When phenyl triflimide $\left(\mathrm{PhNTf}_{2}\right)$ was used instead of $\mathrm{Tf}_{2} \mathrm{O},{ }^{16}$ the reaction proceeded rapidly. The stereoselectivity of the resulting vinyl triflate was high ( $Z / E=95 / 5$ ) (Entry 3 ). DBU was chosen as the base because no reaction occurred using other bases such as DTBMP and $\mathrm{Et}_{3} \mathrm{~N}$. Other $\beta$-benzyloxy-type vinyl triflates 2B-2D were also obtained stereoselectively from the corresponding $\alpha$-alkoxyacetoaldehydes 1B-1D (Entries 4-6). Furthermore, $\alpha$-(propargyloxy)acetoaldehyde 1E could be stereoselectively transformed into the corresponding vinyl triflate 2E stereoselectively (Entry 7); using 2.5 equiv of DBU improved the chemical yield (Entry 8).

${ }^{c}$ DBU (2.5 equiv).

Next, the cross-coupling reaction was investigated using ( $Z$ )- $\beta$-alkoxy vinyl triflate 2. Introduction of a phenyl group was accomplished via Suziki-Miyaura coupling with $\mathrm{PhB}(\mathrm{OH})_{2}$ and using $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ as a catalyst ${ }^{17}$ to give the $\beta$-alkoxy styrenes with retention of $Z$-stereochemistry as shown in Table 2.

${ }^{c} \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\left(0.10\right.$ equiv) at a reaction temperature of $60^{\circ} \mathrm{C}$.

Suzuki-Miyaura coupling reaction of vinylic borane compounds generated in situ was performed as shown in Eq. $1 .{ }^{18}$ The diene 3Ab was obtained with nearly full retention of stereochemistry. ${ }^{19}$

Sonogashira coupling was also examined (Table 3). ${ }^{20}$ 3,3-Dimethyl-1-butyne was used as a substrate for the transformation to give $Z$-enynes 3Ac and 3Ec in high chemical yield with high stereoselectivity.

${ }^{b} 3,3$-Dimethyl-1-butyne ( 2 equiv); CuI ( 0.1 equiv).

Next, an alkyl group was introduced via alkyl boron reagent generated in situ from styrene and 9BBN. ${ }^{21}$ However, the reaction was sluggish and a mixture of the desired product, benzyl vinyl ether, and inseparable byproducts was obtained in poor yield. After intensive investigation, Kumada-Tamao-Corriu coupling reaction of $\mathbf{2 A}$ using $n-\mathrm{BuMgCl}$ in the presence of $\mathrm{NiCl}_{2}(\mathrm{dppp})^{22}$ resulted in the addition of a primary alkyl group. Although slight isomerization was observed, the corresponding vinyl ether 3Ad was obtained with high $Z$-selectivity (Table 4, Entry 1). In contrast, the coupling reaction of propargyloxy triflate $\mathbf{1 E}$ underwent extensive isomerization to give a $c a$. 2/1 mixture of 3Ed (Entry 2).

Table 4. Introduction of an Alkyl Group via Kumada-Tamao-Corriu Coupling

| Entry | $\mathrm{R}^{1}$ | $\mathbf{2}(Z / E)^{a}$ | Time | $\mathbf{3}$ | Yield $/ \%$ | $Z / E^{a}$ |

${ }^{a}$ The ratios were determined by $400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectra.

After establishing a procedure for addition of substituents via cross-coupling reaction of vinyl triflates 2, the [1,2]-Wittig rearrangement of vinyl ethers 3 was investigated. For benzyl-type ethereal substrates 3Aa, 3Ba, 3Da, 3Ab, and 3Ac the rearrangement proceeded to give the
corresponding ( $Z$ )-allylic alcohols stereoselectively (Table 5, Entries 1, 2, 4, 6, and 7). In the case of of (4-methoxyphenyl)methyl ether 3Ca, a specific reaction conditions were required. When the 3Ca was treated with $n-\operatorname{BuLi}$ (3.0 equiv) in THF, the rearrangement did not proceed cleanly and yielded the allylic alcohol 4Ca in low yield of $19 \%$ with $92 / 8$ selectivity. By the addition of $N, N, N^{\prime}, N^{\prime}-$ tetraethylenediamine (TMEDA) using an excess amount of $n-\mathrm{BuLi}, 4 \mathrm{Ca}$ was obtained in enhanced chemical yield (Entry 3). Although the reaction of propargylic ethers 3Ea and 3Ec provided rearranged alcohols at slightly lower chemical yields, excellent $Z$-stereoselectivity was realized (Entries 5 and 8 ). Using a vinyl ether with a primary alkyl group at the $\beta$-position, treatment with $n$ BuLi gave a complex mixture. In this case, the addition of TMEDA using an excess amount of $n$ BuLi was also effective to realize the rearrangement affording ( $Z$ )-allylic alcohol 4Ad in good chemical yield (Entry 9).

${ }^{a}$ The ratios were determined by $400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectra.
${ }^{b} n$-BuLi (8 equiv) and TMEDA (1 equiv) were added.
${ }^{c}$ Temperature was adjusted from $-78{ }^{\circ} \mathrm{C}$ to rt over 10 min .
${ }^{d}$ Ratio of $(1 Z, 3 E)$-isomer/other isomers was $87 / 13$.

In summary, a useful synthetic scheme for $(Z)$-allylic alcohols was established based on the novel (Z)-selective vinyl-triflation of $\alpha$-alkoxyacetoaldehydes followed by cross-coupling and [1,2]Wittig rearrangement. This synthetic scheme allowed the preparation of a wide array of structurally diverse ( $Z$ )-allylic alcohols in a stereoselective manner. These ( $Z$ )-allylic alcohols are versatile synthetic intermediates for stereospecific transformations such as Katsuki-Sharpless and related epoxidations and Simmons-Smith cyclopropanation. ${ }^{23,24}$ The synthetic method presented here can be used in place of the technique using ( $Z$ )-allylic alcohols with triple bonds, which could not be prepared by conventional Lindlar reduction of diynols. ${ }^{25}$

## EXPERIMENTAL SECTION

General Method. ${ }^{1}$ H NMR spectra were recorded on a 400 MHz NMR spectrometer. Chemical shifts $\delta$ are reported in ppm using TMS as an internal standard. Data are reported as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet), coupling constant $(J)$ and integration. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a 100 MHz NMR spectrometer. The chemical shifts are reported relative to $\mathrm{CDCl}_{3}(\delta=77.0 \mathrm{ppm})$. The wavenumbers of maximum absorption peaks in IR spectra are presented in $\mathrm{cm}^{-1}$. HRMS (EI positive, ESI-TOF) spectra were measured with quadrupole and TOF mass spectrometers. All of the melting points were measured with a micro melting point apparatus. THF was freshly distilled from sodium diphenylketyl. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled and stored over drying agents. Anhydrous $\mathrm{CH}_{3} \mathrm{CN}$ was purchased and stored over drying agents.

2-((2-Methylbenzyl)0xy)ethanol. To a suspension of $\mathrm{NaH}(2.4 \mathrm{~g}, 60 \%$ in mineral oil, 60 mmol$)$ in THF ( 160 mL ) was added ethylene glycol ( $10.0 \mathrm{~mL}, 180 \mathrm{mmol}$ ) in THF $(40 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere. After 30 min of stirring, 1-(chloromethyl)-2-methylbenzene ( 9.66 g 60 mmol ) in THF $(40 \mathrm{~mL})$ and $n$-Bu ${ }_{4} \mathrm{NI}(1.11 \mathrm{~g}, 1.2 \mathrm{mmol})$ were added, and the mixture was refluxed for 1 d . Water was added and aqueous layer was separated and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and solvent was removed under reduced pressure. The crude product was purified by silica gel column chromatography (hexane $/ \mathrm{AcOEt}=$ 3/1) to give 2-((2-methylbenzyl)oxy)ethanol (7.08 g, 64\%) as an oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $2.24(\mathrm{~s}, 3 \mathrm{H}), 2.42(\mathrm{brs}, 2 \mathrm{H}), 3.46-3.49(\mathrm{~m}, 2 \mathrm{H}), 3.62(\mathrm{dd}, J=9.2,5.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.44(\mathrm{~s}, 2 \mathrm{H}), 7.05-$
$7.14(\mathrm{~m}, 3 \mathrm{H}), 7.19-7.22(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 18.7, 61.7, 71.4, 71.5, 125.7, 127.9, 128.6, 130.2, 135.7, 136.6. IR (neat): $3421,2865,1459,1355,1102,893,745 \mathrm{~cm}^{-1}$. HRMS (ESITOF): calcd for $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{O}_{2} \mathrm{Na}\left[(\mathrm{M}+\mathrm{Na})^{+}\right]$189.0891, found 189.0887.

2-((2-Methylbenzyl)oxy)acetaldehyde (1B). To a solution of oxalyl chloride ( $1.27 \mathrm{~mL}, 15 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ was added DMSO $(1.42 \mathrm{ml}, 20 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$. After 5 min of stirring, 2-((2-methylbenzyl)oxy)ethanol $(1.66 \mathrm{~g}, 10 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{~mL})$ was added dropwise. After 15 min , the reaction mixture was added $\mathrm{Et}_{3} \mathrm{~N}(7.0 \mathrm{~mL}, 50 \mathrm{mmol})$ and allowed to warm to rt . After 1 h of stirring, the insoluble substrate in the reaction mixture was filtered off through a bed of Celite and solvent was evaporated. The residue was purified by silica gel column chromatography (hexane/ $\mathrm{AcOEt}=3 / 1$ ) to give $\mathbf{1 B}(1.16 \mathrm{~g}, 71 \%)$ as an oil. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): 2.28(\mathrm{~s}, 3 \mathrm{H}), 4.00(\mathrm{~d}, J=0.9 \mathrm{~Hz}, 2 \mathrm{H}), 4.54(\mathrm{~s}, 2 \mathrm{H}), 7.06-7.17(\mathrm{~m}, 3 \mathrm{H}), 7.20-7.23(\mathrm{~m}, 1 \mathrm{H})$, $9.61(\mathrm{t}, J=0.9 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 18.7, 71.9, 75.2, 125.8, 128.3, 128.9, 130.4, 134.7, 136, 9, 200.5. IR (neat): 3029, 2867, 1736, 1492, 1460, 1376, 1104, $746 \mathrm{~cm}^{-1}$. HRMS (ESITOF): calcd for $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{2} \mathrm{Na}\left[(\mathrm{M}+\mathrm{Na})^{+}\right]$187.0735, found 187.0740.
In a similar manner, 2-alkoxyacetoaldehyde $\mathbf{1 A},{ }^{26} \mathbf{1 C},{ }^{27}$ and $\mathbf{1 D}{ }^{28}$ were prepared from ethylene glycol.

Ethyl 2-((3-(Triisopropylsilyl)prop-2-yn-1-yl)oxy)acetate. To a solution of 3-(triisopropylsilyl)prop-2-yn-1-ol ${ }^{29}(3.19 \mathrm{~g}, 15 \mathrm{mmol})$ and HMPA ( $10.4 \mathrm{~mL}, 60 \mathrm{mmol}$ ) in THF ( 15 mL ) was added $\mathrm{MeMgBr}\left(15 \mathrm{~mL}\right.$ of 1.0 M solution in THF, 15 mmol ) dropwise at $0{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere. After 10 min of stirring, ethyl bromoacetate ( $2.51 \mathrm{~g}, 15 \mathrm{mmol}$ ) in THF ( 5 mL ) was added, and the resulting solution was warmed $50^{\circ} \mathrm{C}$, and stirred for 1 h . The reaction mixture was quenched with a satd aq solution of $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$. After insoluble substance was filtered off through a bed of Celite, the organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was evaporated. The crude product was purified by silica gel column chromatography (hexane/AcOEt $=20 / 1$ ) to give ethyl 2-((3-(triisopropylsilyl)prop-2-yn-1-yl)oxy)acetate (1.92 g, $49 \%$ ) as an oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $1.00(\mathrm{~s}, 21 \mathrm{H}), 1.23(\mathrm{t}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 4.16(\mathrm{~s}, 2 \mathrm{H}), 4.17(\mathrm{q}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H})$, 4.29 (s, 2H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 11.0, 14.1, 18.5, 58.9, 60.9, 65.7, 89.1, 101.7, 170.0. IR (neat): 2944, 2865, 2171, 1754, 1463, 1204, 1121, 1000, 883, $677 \mathrm{~cm}^{-1}$. HRMS (EI): calcd for $\mathrm{C}_{16} \mathrm{H}_{30} \mathrm{O}_{3} \mathrm{Si}\left[\mathrm{M}^{+}\right]$298.1964, found 298.1981.

2-((3-(Triisopropylsilyl)prop-2-yn-1-yl)oxy)acetaldehyde (1E). To a solution of ethyl 2-((3-(triisopropylsilyl)prop-2-yn-1-yl)oxy)acetate ( $1.92 \mathrm{~g}, 7.4 \mathrm{mmol}$ ) in toluene ( 50 mL ) was added DIBAL-H ( 7.4 mL of 1.0 M solution in toluene, 7.4 mmol ) dropwise over 5 min at $-78^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere. After $5 \mathrm{~min}, \mathrm{MeOH}(7 \mathrm{~mL})$ was added and the reaction mixture was warmed to room temperature. A satd aq solution of potassium sodium tartrate was added and the resulting mixture was stirred for 3 h . After insoluble substance was filtered off through a bed of Celite, the aqueous layer was separated and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was evaporated. The crude product was purified by silica gel column chromatography (hexane/ $\mathrm{AcOEt}=6 / 1$ ) to give $\mathbf{1 E}(1.00 \mathrm{~g}, 53 \%)$ as an oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $1.07(\mathrm{~s}, 21 \mathrm{H}), 4.21(\mathrm{~s}, 2 \mathrm{H}), 4.35(\mathrm{~s}, 2 \mathrm{H}), 9.77(\mathrm{~s}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 11.0, 18.5, 59.5, 74.3, 89.5, 101.6, 200.1. IR (neat): 2943, 2891, 2865, 2716, 1739, $1463,1382,1366,1242,1114,1009,883,678 \mathrm{~cm}^{-1}$. HRMS (EI): calcd for $\mathrm{C}_{14} \mathrm{H}_{26} \mathrm{O}_{2} \mathrm{Si}\left[\mathrm{M}^{+}\right]$ 254.1702, found 254.1706 .
(Z)-2-(Benzyloxy)vinyl Trifluoromethanesulfonate (2A). To a solution of $\mathbf{1 A}$ ( $597 \mathrm{mg}, 4.0$ $\mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(35 \mathrm{~mL})$, $\mathrm{DBU}(1.21 \mathrm{~g}, 8.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ and $\mathrm{PhNTf}_{2}(1.71 \mathrm{~g}, 4.8$ $\mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ were added at rt under Ar atmosphere. After reaction completion (monitored by TLC), the reaction was quenched with a phosphate buffer solution ( pH 7 ). The aqueous layer was separated and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and solvent was evaporated. The crude product was purified by silica gel column chromatography (hexane $/ \mathrm{AcOEt}=6 / 1$ ) to give $\mathbf{2 A}(948 \mathrm{mg}, 84 \%, Z / E=95 / 5$ mixture from ${ }^{1} \mathrm{H}$ NMR) as an oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 4.94 (s, 2H), $6.00(\mathrm{~d}, J=3.2 \mathrm{~Hz}$, $1 \mathrm{H}), 6.04(\mathrm{~d}, ~ J=3.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.27-7.42(\mathrm{~m}, 5 \mathrm{H})$. The reaction was quenched with water. The aqueous layer was separated and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and solvent was evaporated. The crude product was purified by silica gel column chromatography (hexane/ $\mathrm{AcOEt}=8 / 1$ ) to give $\mathbf{4 C a}(10$ $\mathrm{mg}, 47 \%, Z / E=97 / 3)$ as an oil. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 3.82(\mathrm{~s}, 3 \mathrm{H}), 5.60(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H})$, $5.95(\mathrm{dd}, J=11.4,9.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.67(\mathrm{~d} J=11.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.91(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.26-7.38(\mathrm{~m}$, 7 H ), the signal of OH proton was not clearly observed. Selected data of $(E)$-isomer; 5.25 (d, $J=6.9$ $\mathrm{Hz}, 1 \mathrm{H}), 6.27(\mathrm{dd}, J=13.8,6.9 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{32}{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 55.3, 69.7, 114.0, 127,4, $127.6,128.3,128.8,130.9,133.4,135.4,136.4,159.2$. IR (neat): 3371, 3057, 3021, 2956, 2934,

2835, 1610, 1509, 1463, 1302, 1247, 1173, 1032, 831, $699 \mathrm{~cm}^{-1}$. HRMS (EI): Calcd for $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{O}_{2}$ [ $\mathrm{M}^{+}$]: 240.1150. Found: 240.1148.

In a similar manner, $(Z)$-allylic alcohol 4Ad was obtained from the corresponding $(Z)$-vinyl ether 3Ad.
(Z)-1-Phenylhept-2-en-1-ol (4Ad). ${ }^{25}$ Compound 4Ad ( $57 \mathrm{mg}, 81 \%, Z / E=89 / 11$ ) was obtained as an oil from 3Ad ( $70 \mathrm{mg}, 0.37 \mathrm{mmol}, Z / E=91 / 9$ ) , TMEDA ( $54 \mu \mathrm{~L}, 0.36 \mathrm{mmol}$ ) and $n$-BuLi in hexane ( $1.76 \mathrm{~mL}, 1.65 \mathrm{M}$ solution in hexane, 2.9 mmol ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $0.92(\mathrm{t}, J=$ $6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.30-1.43(\mathrm{~m}, 4 \mathrm{H}), 1.81(\mathrm{~d}, J=2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.14-2.30(\mathrm{~m}, 2 \mathrm{H}), 5.52-5.59(\mathrm{~m}, 3 \mathrm{H})$, 7.24-7.80 (m, 5H). Selected data of (E)-isomer: 2.03-2.09 (m, 2H), 5.17 (d, $J=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.67$ $(\mathrm{dd}, J=15.6,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.77(\mathrm{dt}, J=15.6,6.4 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{33}{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 13.9$, $22.3,27.4,31.7,69.7,125.9,127.4,128.5,131.8,132.4,143.7$.

## Supporting Information:

Copies of ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra of products. This material is available free of charge via the Internet at http://pubs.acs.org/.

## ACKNOWLEDGEMENTS

This work was financially supported in part by a Grant-in-Aid for Scientific Research from the Japan Society for the Promotion of Science (JSPS).
