# 2000 Fiscal Year Final Research Report Summary

## Study for the aim of gene therapy of nasopharyngeal carcinoma

Research Project

### Project/Area Number

10470353

### Research Category

Grant-in-Aid for Scientific Research (B).

### Allocation Type

Single-year Grants

### Section

一般

### Research Field

Otorhinolaryngology

### Research Institution

Kanazawa University

### Principal Investigator

**FURUKAWA Mitsuru** School of Medicine Kanazawa University Professor, 医学部, 教授 (40092803)

### Co-Investigator(Kenkyū-buntansha)

TAKESHITA Hajime University Hospital Kanazawa University Assistant, 医学部・附属病院, 助手 (40272976)

YOSHIZAKI Tomokazu University Hospital Kanazawa University Assistant Professor, 医学部・附属病院, 講師 (70262582)

### Project Period (FY)

1998 - 2000

### Keywords

NPC / EBV / BZLF1 / LMP1 / MMP9 / Metastasis / Invasiveness / Gene therapy

### Research Abstract

Nasopharyngeal carcinoma (NPC), an epithelial tumor which is characterized by marked geographic and population differences in incidence, is found to be associated with Epstein-Barr virus (EBV) by serologic evidence, and the relationship was confirmed by the detection of EBVDNA and EB-encoded RNAs in NPC cells. While, NPC is highly metastatic carcinoma whose consistent associated with EBV has been established. Latent membrane protein 1 (LMP1), an EBV membrane protein expressed in latent infection is considered to be the EBV oncoprotein. Matrix metalloproteinase 9 (MMP9), one of the MMP families, degrades Type IVcollagen, a major 4 component of extracellular matrix and is believed to be crucial for cancer invasion and metastasis. Although MMP9 is reported to be expressed in a variety of cancers, no reports concerning NPC have been published. We have shown that LMP1 induces MMP9 in vitro cell line, which suggests the possibility of mechanism in which LMP1 of EBV contributes to the metastasis. [▶ More](#)
