

初島住彦* 九州産マンネングサの新種

S. HATUSIMA* : A New Species of *Sedum* from Kyusyu***Sedum satumense*** HATUSIMA, sp. nov.

Herba perennis, toto viridis glaberrima, 5-10 alta. Caulis floriferi saepe e basi 2-3-ramiferi, parte superiore simplices vel laxe ramosi, internodiis 2-3 mm. longis. Folia opposita, obovato-spathulata vel anguste ovata, complanata, apice obtusa, basi attenuata, ca. 1 cm. longa et 5-6 mm. lata. Flores in corymbum dispositi, ca. 3 cm. diametro, pentameri, sessili. Sepala oblanceolata ca. 2-3 mm. longa, apice rotundata, parum inaequilonga. Petala libera, luteola, ovato-lanceolata, apice acuminata, ca. 4 mm. longa. Stamina 10, interpetala ca. 3 mm. longa, epipetala 3 mm. longa sine antheris. Antheris luteolis 0.5 mm. longis. Carpella 5, subrecta, oblonga, apice acuminata ca. 3 mm. longa.

Type : Cultivated plant in Kagoshima city, grown from living material from Mt. Isoma, Prov. Satuma (in herb. Facult. Agric. Kagoshima Univ.).

This is near to *S. formosana* N. E. BR., but differs from it by not annual or biennial but perennial habit, and its not rubescent but green stems. *S. alfredi* var. *nagasakianum* HARA is also near to the present species but differs by its alternate leaves

摘 要

サツマンネングサ (新称) 薩摩の磯間山の頂上の岩場に一種のマンネングサがあり色々研究の結果新種と思われるので発表する。本種は一見ナガサキマンネングサに似ているが葉は対生で白味がないので区別出来る。シマンネングサにも一寸似ているが、多年生草本で全体に赤味がなく、葉は対生であるので区別出来る。
