2007 Fiscal Year Final Research Report Summary

A study of arthritic mechanism of the temporomandibular joint disorders

Research Project

Project/Area Number

17592069

Research Category

Grant-in-Aid for Scientific Research (C)

Allocation Type

Single-year Grants

Section

一般

Research Field

Surgical dentistry

Research Institution

Kanazawa University

Principal Investigator

TAKATSUKA Shigeyuki Kanazawa University, Universty Hospital, Assistant Professor (00251926)

Co-Investigator(Kenkyū-buntansha)

NAKAGAWA Kiyomasa Kanazawa University, Graduate School of Medical Science, Associate Professor (30155676)

YAMAMOTO Etsuhide Kanazawa University, Graduate School of Medical Science, Professor (00092445)

HUKUDA Ryuji Kanazawa University, Graduate School of Medical Science, Associate Researcher (60027331)

Project Period (FY)

2005 – 2007

Keywords

temporomandibular disorder / articular disc / synovial fluid / aggrecanase(ADAMTS) / matrix metalloproteinase(MMP) / fibrous adhesion

Research Abstract

1. Experimental study of temporomandibular joint arthritis in the rabbits

Proteolytic activities of the temporomandibular arthritis have been investigated using a rabbit model of temporomandibular disorders. Histopathologic examination has been achieved on the arthritis caused by an artificial dislocation of the articular disc. Throughout the examination period, histoimmunohistochemical staining showed expression of proteolytic enzymes such as matrix metalloproteinases (MMPs) and aggrecanase(ADAMTS). Especially in the critical destructive period, specimens showed higher incidence of enzymatic expression. Expression of type I and H collagen stain were also noticed in the cartilage layer of the mandibular condyle. Distribution of these components differed according to the destruction periods.

2. Analyses of the clinically harvested materials

Histopathologic and biochemistic examination have been carried out using human materials of synovial fluid and biopsy tissue from the upper joint compartment of the temporomandibular joints, under informed consent. In patients with prominent arthritic changes on Milk showed higher incidence of MMP5 and ADAMTS. During cartilage matrix destruction, ADAMTS first acts on proteoglycan breakdown, then MMPs act on proteoglycan and collagen breakdown. These enzymatic expressions have been noticed in RA patients in the field of Orthopedic Surgery. Conversely in the present study, high incidence of both enzymatic activities has been noticed in the temporomandibular joints. From the results, arthritis may be mild in the temporomandibular joints. Harvested adhesion tissue via arthroscopic surgery showed a number of fibro-blastic cells. Specimens from advanced stage of arthritis showed ossification or cartilaginous degeneration. These lesions are frequently showed in preoperative MRI images.
