2006 Fiscal Year Final Research Report Summary

Development of an assessment standard of patients' ability for a diabetes medical treatment action

Research Project

Project/Area Number

16592139

Research Category

Grant-in-Aid for Scientific Research (C)

Allocation Type

Single-year Grants

Section

一般

Research Field

Clinical nursing

Research Institution

Kanazawa University

Principal Investigator

INAGAKI Michiko Kanazawa University, Graduate School of Medical Science, Professor (40115209)

Co-Investigator(Kenkyū-buntansha)

TASAKI Keiko Kanazawa University, Graduate School of Medical Science, Assistant (70345635)

MATSUI Kiyoko Kanazawa University, Graduate School of Medical Science, Assistant (90283118)

MURAKADO Naoko Kanazawa University, Graduate School of Medical Science, Assistant (30303283)

KAWAMURA Kaumi Kanazawa University, Graduate School of Medical Science, Associate Professor (50251963)

Project Period (FY)

2004 – 2006

Keywords

diabetes Mellitus / assessment / standard / patient education / diabetes care

Research Abstract

The purpose of this study is to develop an assessment standard of compound ability for diabetes patients and their families about a diabetes medical treatment action, and to establish evaluation methods.

We extracted standard items from reviewing literature documentations and foregoing researches and analyzed validity of items by considering results of questionnaire

survey to diabetes patients. Subsequently we performed interview to patients and nurses who practiced diabetes education, and confirmed adequacy of these items. We got approval as ethical care in Kanazawa University medical ethics examination committee.

We made up a standard comprising 40 items which are compounded by two profiles, "an implementation of diabetes medical treatment action and assessment ability" and "a manner to live with diabetes mellitus and knowledge". It was confirmed that these items could assess a diabetes medical treatment action by answers of 51 patients hospitalized for diabetes education and their values of HbA1c which is an index for diabetes control. Subsequently we declared 7 viewpoints which nurses get as effects resulting educational hospitalization and these are included in 40 items. In addition, we found 7 goals which nurses picture for diabetic patients hospitalized for educational purposes. Therefore we could decide possibility of these assessment items and confirm their usefulness as diabetes patients assessment tool on the first interview going into hospital.
