2004 Fiscal Year Final Research Report Summary

Study on biological mechanism, specially, information transmittance by malting use of high resolution spectroscopic method

Research Project

Project/Area Number

14340177

Research Category

Grant-in-Aid for Scientific Research (B)

Allocation Type

Single-year Grants

Section

一般

Research Field

Physical chemistry

Research Institution

Kanazawa University

Principal Investigator

OHASHI Nobukimi Kanazawa University, Graduate School of Natural Science & Technology, Professor, 自然科学研究科, 教授 (40019493)

Co-Investigator(Kenkyū-buntansha)

HIROTA Eizi The Graduate University for Advanced Studies, Emeritus Professor, 教授 (30011464)

KAWASHIMA Yoshiyuki Kanagawa Institute of Technology, Faculty of Engineering, Professor, 工学部, 教授 (60131009)

FUJITAKE Masaharu Kanazawa University, Graduate School of Natural Science & Technology, Assistant Professor, 自然科学研究科, 助教授 (40212188)

Project Period (FY)

2002 – 2004

Keywords

peptide molecules / large amplitude vibration / internal rotation / microwave spectrum / Fourier transform spectrum / two-top molecules / three-top molecules

Research Abstract

In the present project, a nozzle-jet Fourier transform microwave (ETTMW) spectrometer was newly constructed in Kanazawa University, and the FTMW existing already in Kanagawa Institute of Technology was revised. Using these two FTMW spectrometers, and also using the instrument in National Institute of Standards and Technology (NIST) of U.S.A. through collaborative work, pure rotational spectra of peptide molecules and other molecular species involving large-amplitude motions were investigated to obtain information on intra-molecular interactions useful for understanding mechanism of biological information transmittance. Molecular species studied in the present

project are dimethyl methylphosphonate, N-methylpropionamide, N-methylformamide, N-methylacetamide, 1,1-dimethylsilacyclobutane, N-methylaniline, N,N-dimethylacetamide, Ar-dimethyl ether complex, Ne-dimethyl ether complex etc. For examples, a transition probability relating to transmittance of the three CH₃-internal rotations occurring through Coriolis interaction between overall-rotation and internal-rotation was obtained for the N,N-dimethylacetamide, and a contribution to a rotational constant of the interaction between CH₃-internal rotation and ring-puckering motion was determined for the 1,1-dimethylsilacyclobutane molecule. Information involved in these quantities is useful, which are considered to be strongly related to information transmittance of fiologically related molecules.
