#### Abstract

Total syntheses of biliverdin derivatives with a Z-syn, Z-anti, or E-syn CD-ring components were accomplished via new and efficient methods for the construction of sterically locked CD-ring components towards the elucidation of the stereochemistry of the chromophore in phytochromes.

Light is vital for photosynthesis, and it is also necessary for directing plant growth and development. The sensing of light in environmental conditions is essential for plants as vision is for animals. To fine-tune their development according to light intensity, direction, wavelength, and periodicity, they possess multiple light sensors. There are several light-sensing systems involved in these responses, such as the blue light sensitive system with cryptochrome ${ }^{1 \mathrm{a}}$ or phototropin ${ }^{1 \mathrm{~b}}$ and the red light sensitive system with phytochrome. ${ }^{1 \mathrm{c}}$ Phytochromes are chromoproteins that have either phytochromobilin (РФВ) or phytocyanobilin (PCB) as a chromophore, which is covalently bound to the protein by a thioether bond through an A-ring ethylidene side chain and responds to red and far-red light through a reversible interchange between $Z$ - and $E$-forms
at the C15 position of the chromophores (Fig. 1). ${ }^{2}$ This double-bond photoisomerization converts the physiologically inactive red light absorbing $\mathrm{P}_{\mathrm{r}}$ form into the active far-red light absorbing $\mathrm{P}_{\mathrm{fr}}$ form and vice versa. The interchange between the $P_{r}$ and $P_{f r}$ forms is essential for light absorbing biological processes in the phytochrome chromophore function. Some bacterial phytochromes have biliverdin (BV) as a natural chromophore, and we have recently determined that BV covalently binds to the apoprotein of Agrobacterium phytochrome Agp1 via its A-ring vinyl side chain. ${ }^{3}$

During photoconversion, the chromophore also moves around the exocyclic single bonds. In principle, each single bond can adopt either a syn or anti conformation. ${ }^{4}$ Vibrational spectroscopy provided indirect insight into the conformation of

Fig. 1. Photoreversibility of phytochromes between $P_{r}$ and $P_{f r}$, and the structure of phytochrome chromophores.
the phytochrome chromophore in the $\mathrm{P}_{\mathrm{r}}, \mathrm{P}_{\mathrm{fr}}$, and intermediate states, but the data were ambiguous and have been interpreted in different ways. ${ }^{2,5-7}$ For example, it was proposed that the formation of $\mathrm{P}_{\mathrm{fr}}$ is accompanied by a syn/anti rotation around the C14-C15 single bond. ${ }^{5}$ More recently, interpretation of resonance Raman spectra by density functional theory calculations proposed that the $\mathrm{C} 14-\mathrm{C} 15$ single bond is in an anti conformation throughout the entire photocycle and that the C5-C6 single bond rotates from anti to syn upon conversion from $\mathrm{P}_{\mathrm{r}}$ to $\mathrm{P}_{\mathrm{fr}}$ as shown in Fig. 1. ${ }^{2}$
To analyze the structure and function of the chromophore in phytochromes, we have studied on the total syntheses of natural and unnatural chromophores. ${ }^{8-11}$ In this paper, we describe the syntheses of three different types of BV derivatives, in which the stereochemistry between the rings C and D are locked in Z-syn, Z-anti, and E-syn configuration and conformation, ${ }^{12}$ respectively, to determine the stereochemistry of the chromophore at the C 15 position of $\mathrm{P}_{\mathrm{r}}$ and $\mathrm{P}_{\mathrm{fr}}$ forms and the function of the reconstituted Agp1. The retro-synthetic analyses of the three chromophores are shown in Fig. 2.

## Results and Discussion

Preparation of Allyl (Z)-3-(4-Methyl-5-\{[4-methyl-5-oxo-3-vinyl-1H-pyrrol-2(5H)-ylidene]methyl\}-1H-pyrrol-3-yl)propanoate (4). The AB-ring component 4 is common for all chromophores prepared herein. We previously reported that it can be readily prepared by cleavage of BV diallyl ester with thiobarbituric acid in methanol; however, unusable barbituric acid adducts were produced at the same time. ${ }^{13 \mathrm{c}}$ Therefore, an alternative method was developed starting from 3-methyl-4-[2-( $p$-tolylthio)ethyl]-5-tosyl-1,5-dihydro- 2 H -pyrrol-2-one ${ }^{8 f}$ (11) as the A-ring precursor and $t$-butyl 3-(3-allyloxy-3-oxo-propyl)-5-formyl-4-methyl-1 H -pyrrole-2-carboxylate ${ }^{8 \mathrm{c}}$ (10a), the latter of which is a precursor common to the B - and C -rings of BV, as shown in Scheme 1. Compounds 11 and 10a were
coupled according to the original Wittig-type coupling reaction $^{8 \mathrm{~b}}$ in which tributylphosphine and 1,8-diazabicyclo[5.4.0]-

undec-7-ene (DBU) are used in THF to afford a mixture of $Z$ and $E$-isomers of the AB-ring precursor $\mathbf{1 2}$ bearing a $p$-tolylthioethyl side chain in $88 \%$ yield. Compound $\mathbf{1 2}$ was converted to the corresponding sulfoxide with $m \mathrm{CPBA}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, followed by treatment with a mixture of formic acid and trifluoroacetic acid (TFA) at $5^{\circ} \mathrm{C}$ to afford the decarboxylated dipyr-rin- $1(10 H)$-one intermediate 13 . The crude product 13 was refluxed in DMF in the presence of pyridine to afford the desired AB-ring component $\mathbf{4}$ as only $Z$-isomer in $57 \%$ yield in three steps from compound $\mathbf{1 2}$.

Preparation of Allyl (Z)-3-(2-Ethyl-8-formyl-1,10-di-methyl-3-oxo-5,6-dihydro-3H-dipyrrolo[1,2-d:2', $\left.\mathbf{1}^{\prime}-g\right][1,4]-$ diazepin-9-yl)propanoate (5). The sterically locked CD-ring component 5 bearing Z-syn configuration and conformation was prepared via our Wittig-type coupling reaction between 3-ethyl-4-methyl-5-tosyl-1,5-dihydro-2H-pyrrol-2-one ${ }^{8 b}$ (9a) and formylpyrrole 10a in the presence of a mixture of tributyl-
phosphine and DBU in THF to afford a mixture of coupling products $(Z)$ - and $(E)-\mathbf{8 a}$ in $87 \%$ yield (Scheme 2 ). The coupling product $(E)$-8a was readily converted to the corresponding isomer ( $Z$ )-8a by treatment with a catalytic amount of iodine in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ in $95 \%$ yield. Compound (Z)-8a, thus obtained, was then reacted with 1,2-dibromoethane in the presence of NaH in THF to afford the cyclized CD-ring component $\mathbf{1 4}$ in $84 \%$ yield. The $t$-butoxycarbonyl group of compound 14 was converted to a formyl group by treating with TFA followed by addition of trimethyl orthoformate $(\mathrm{MeO})_{3} \mathrm{CH}$ at room temperature to give the formylated CD-ring component 5 in quantitative yield.

Preparation of $t$-Butyl 3-(3-Allyloxy-3-oxopropyl)-4-(2-chloroethyl)-5-formyl-1H-pyrrole-2-carboxylate (10b). The formylpyrrole derivative ${ }^{11} \mathbf{1 0 b}$ was prepared starting from the commercially available 3-bromo-1-propanol (15) as shown in Scheme 3. Alcohol 15 was first acetylated using acetic

Scheme 4.

$\xrightarrow[\substack{\text { 2) } \mathrm{TFA}, \text { DMSO ( } 4.0 \text { equiv.) } \\ \text { rt, overnight } \\ \mathrm{Zn}(2.0 \text { equiv.) } \\ \mathrm{rt}, 1 \mathrm{~h}}]{\substack{\mathrm{MsCl}\left(1.2 \text { equiv.) } \\ \mathrm{THF}, 0^{\circ} \mathrm{C} \rightarrow \mathrm{rt}, 30 \mathrm{~min}\right.}}$
Scheme 5.
anhydride in the presence of catalytic amount of 4-(dimethylamino)pyridine (DMAP) in THF, followed by nitration with sodium nitrite in the presence of phloroglucinol in DMF to give 3-nitropropyl acetate (16) in $53 \%$ yield in two steps. Compound 16 was coupled with the oxo-ester 17 in a manner similar to our previous preparation of the B- and C-rings, ${ }^{8 c, g}$ followed by acetylation of the resulting nitro-alcohol to give the nitro-acetate $\mathbf{1 8}$ which was contaminated with the corresponding nitro-olefin. When compound 18 was treated with $t$-butyl isocyanoacetate and DBU according to Barton's method $^{14}$ in acetonitrile, the pyrrole derivative 19 was obtained in $55 \%$ yield. Hydrolysis of compound 19 with KOH in MeOH , followed by allylation with allyl bromide in the presence of DBU in THF/DMF afforded the pyrrole 20 in $60 \%$ yield. When compound 20 was formylated by Vilsmeier reaction to give the formylated product in situ, chlorination of the hydroxy group proceeded simultaneously to afford the formylpyrrole 10b bearing 2 -chloroethyl group in $94 \%$ yield.
Preparation of Allyl (Z)-3-(8-Ethyl-2-formyl-9-methyl-7-oxo-1,4,5,7-tetrahydrodipyrrolo[1,2-a:2', $\left.\mathbf{3}^{\prime}-d\right]$ azepin-3-yl)-
propanoate (6). As shown in Scheme 4, compounds 9a and 10b were coupled according to the Wittig-type reaction developed in our laboratory using tributylphosphine in the presence of DBU in THF to afford the CD-ring precursor $\mathbf{8 b}$ as a mixture of $E$ - and $Z$-isomers in $98 \%$ yield. We found that compound $(E)-\mathbf{8 b}$ should be converted to the $Z$-isomer by treating with a catalytic amount of iodine in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ prior to the cyclization. Compound (Z)-8b was cyclized at $50^{\circ} \mathrm{C}$ in the presence of DBU in THF affording the desired product 21 in $76 \%$ yield. Subsequent formylation was accomplished by treating with $(\mathrm{MeO})_{3} \mathrm{CH}$ in TFA to give the formylated CDring component 6 in quantitative yield.

Preparation of 3-Ethyl-4-[2-(mesyloxy)ethyl]-5-tosyl-1,5-dihydro-2H-pyrrol-2-one (9b). The 5-tosylpyrrolinone derivative $9 \mathbf{b}$ was prepared starting from propenal as shown in Scheme 5. Treatment of propenal with acetic acid in the presence of catalytic amount of zinc diacetate afforded 3-oxopropyl acetate (22) in $40 \%$ yield. ${ }^{15}$ Compound 22 was then coupled with 1-nitropropane according to Henry reaction in the presence of catalytic amount of KOH in MeOH . The resulting

nitro-alcohol was then acetylated using acetic anhydride in the presence of catalytic amount of DMAP in THF to give the nitro-diacetate $\mathbf{2 3}$ in $85 \%$ yield in two steps. Compound 23 was reacted under Barton's method conditions, i.e., tosylmethyl isocyanide (TosMIC) in the presence of DBU, to afford tosylpyrrole derivative $\mathbf{2 4}$ in $59 \%$ yield. Compound 24 was then brominated with trimethylphenylammonium tribromide ( $\mathrm{PhMe}_{3} \mathrm{~N}^{+} \mathrm{Br}_{3}{ }^{-}$) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, followed by hydrolysis of the acetoxy group with $1 \mathrm{M}\left(=1 \mathrm{~mol} \mathrm{dm}^{-1}\right)$ aq NaOH in MeOH to give compound $\mathbf{2 5}$ in $72 \%$ yield in two steps. Mesylation and subsequent redox-type reaction ${ }^{8, i}$ using DMSO and zinc in TFA afforded the 5-tosylpyrrolinone derivative 9b in 55\% yield in two steps.

Preparation of Allyl (E)-3-(3-Ethyl-7-formyl-9-methyl-2-oxo-1,2,4,5-tetrahydrodipyrrolo[1,2-a:2', $\left.3^{\prime}-d\right]$ azepin-8-yl)propanoate (7). As shown in Scheme 6, compounds 9b and 10a were coupled by a Wittig-type reaction with tributylphosphine in the presence of DBU in THF to afford directly the cyclized CD-ring component 26 as $E$-syn isomer in 65\% yield. Formylation reaction was carried out by treating with TFA and subsequent addition of $(\mathrm{MeO})_{3} \mathrm{CH}$ to give the formylated CD ring component 7 in $85 \%$ yield.

Construction of the Biliverdin Derivatives as 15Z-syn, 15Z-anti, and 15E-syn Chromophores in Free Acid Forms. Coupling reactions between the CD-ring components 5, 6, and 7 , prepared above, with the $A B-r i n g$ component 4 were carried out in methanol under acidic conditions to afford the sterically locked BV diallyl ester derivatives $\mathbf{1 b}, \mathbf{2 b}$, and $\mathbf{3 b}$ in 69,87 , and $45 \%$ yields, respectively (Table 1).

Finally, the carboxylate groups were deprotected via a $\mathrm{Pd}^{0}-$
catalyzed reaction using sodium $p$-toluenesulfinate ( NaTs ) as a nucleophile in THF/ MeOH to give the desired chromophores $\mathbf{1 a}, \mathbf{2 a}$, and $\mathbf{3 a}$ in 80,90 , and $42 \%$ yields, respectively, in free acid forms.

Chromophores 1a, 2a, and 3a were attached to the Agp1 apoprotein to determine the stereochemistry of CD-ring component of BV in Agp1. It was found that compound 2a, which is a BV derivative having $15 Z a$ configuration and conformation, forms a covalent bond with Agp1 apoprotein, and the absorption spectrum corresponding to $\mathrm{P}_{\mathrm{r}}$ form was observed. Furthermore, size exclusion chromatograph of Agp1-M15 (the $N$-terminal 504 amino acids of Agp1) apoprotein adduct with compound $\mathbf{2 a}$ and the autophosphorylation of the Agp1 adduct with compound 2a showed that the stereochemistry of CD-ring moiety of $\mathrm{P}_{\mathrm{r}}$ form of natural Agp1 is $15 Z a .{ }^{16}$ Recently, we also prepared another derivative of the chromophore in which the stereochemistry of the CD-ring moiety is fixed to $15 E a .{ }^{17}$ This $15 E a$ chromophore was also attached to the Agp1 apoprotein, and the adduct was found to be the $\mathrm{P}_{\mathrm{fr}}$ form of Agp1. ${ }^{16}$ From these results, sterically locked chromophores will open new avenues of investigation concerning the stereochemistry and function of phytochrome chromophores both in vitro and in vivo.

## Experimental

${ }^{1}$ HNMR spectra were recorded on JEOL JNM-GX Lambda 400 and 300 NMR spectrometers. Chemical shifts are reported in $\delta$-scale relative to TMS $(\delta=0)$ as an internal standard. The IR spectra were measured on a JASCO FT/IR-230 spectrometer, and the MS spectra were recorded by using Hitachi M-80 and JEOL SX-102A mass spectrometers. All solvents were distilled and stored over drying agents. THF was freshly distilled from sodium diphenylketyl. Thin-layer chromatography (TLC) and flash column chromatography were performed using Merck's silica gel $60 \mathrm{PF}_{254}$ (Art. 7749) and Cica-Merck's silica gel 60 (No. 9385-5B), respectively. Commercially available reagents were used without further purification, unless otherwise noted.
$t$-Butyl 3-(3-Allyloxy-3-oxopropyl)-4-methyl-5-(\{4-methyl-5-oxo-3-[2-( $p$-tolylthio)ethyl]-1H-pyrrol-2(5H)-ylidene\}methyl)-1H-pyrrole-2-carboxylate (12). To a mixed solution of 5-tosylpyrrolinone ${ }^{8 \mathrm{e}} \mathbf{1 1}(2.0 \mathrm{~g}, 5 \mathrm{mmol})$ and formylpyrrole ${ }^{8 \mathrm{~b}} \mathbf{1 0 a}(1.6 \mathrm{~g}$, $5 \mathrm{mmol})$ in THF ( 30 mL ) was added ${ }^{n} \mathrm{Bu}_{3} \mathrm{P}(2.7 \mathrm{~mL}, 11 \mathrm{mmol})$ dropwise at $0^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$, followed by dropwise addition of DBU ( $0.82 \mathrm{~g}, 5.5 \mathrm{mmol}$ ) in THF ( 2 mL ). The reaction mixture was allowed to stir at room temperature overnight. The solvent was removed under reduced pressure, and the residue was partitioned between EtOAc and water. The organic layer was washed with both a saturated aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}$ and brine, and
then dried over $\mathrm{MgSO}_{4}$. The solvent was evaporated, and the product was separated by flash column chromatography $\left(\mathrm{SiO}_{2}\right.$, hexane/EtOAc $=4 / 1, \mathrm{v} / \mathrm{v}$ ) to give compound $\mathbf{1 2}(2.42 \mathrm{~g}, 88 \%)$ as a yellow solid of the mixture of $(Z)$ - $(60 \%)$ and $(E)$-isomers (28\%). Mp 177.5-178.0 ${ }^{\circ} \mathrm{C}$ (from EtOAc/hexane). 3-(2-Acetoxyethyl)-4-ethyl-2-tosylpyrrole (24). To a mixture of compound $22(1.263 \mathrm{~g}, 10.8 \mathrm{mmol})$ and 1-nitropropane $(8.0 \mathrm{~mL}$, $89 \mathrm{mmol})$ was added 0.5 mL of $1 \mathrm{M} \mathrm{KOH}(0.5 \mathrm{mmol})$ in MeOH at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred for 2 h at room temperature. The mixture was quenched with $1 \mathrm{M} \mathrm{HCl}(0.5 \mathrm{~mL})$, and the solvent was evaporated. The residue was partitioned between EtOAc and water, and the organic layer was washed with a saturated aqueous solution of $\mathrm{NaHCO}_{3}$ and then brine, and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was evaporated to give the crude nitro-alcohol as an oil. To a mixed solution of the resulting nitro-alcohol $(2.09 \mathrm{~g}, 10.2 \mathrm{mmol})$ and DMAP $(124 \mathrm{mg}, 1.02 \mathrm{mmol})$ in THF ( 8.0 mL ) was added dropwise acetic anhydride ( $1.1 \mathrm{~mL}, 12.2 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. After stirring for 2 h at room temperature, the mixture was quenched with $\mathrm{MeOH}(1.7 \mathrm{~mL})$, and then, the solvent was removed under reduced pressure. The residue was partitioned between EtOAc and water, and the organic layer was washed with both a saturated aqueous solution of $\mathrm{NaHCO}_{3}$ and brine, and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was evaporated to give 4-nitrohexane1,3 -diyl diacetate (23) as an oil in $85 \%$ yield ( 2.28 g ) in two steps as a mixture of diastereomers. IR (neat) 2977, 2941, 1746, 1555, 1459, 1373, 1225, 1097, 1048, 948, 809, $732 \mathrm{~cm}^{-1}$. HRMS (FAB) $\left(\mathrm{M}^{+}+1\right)$, Found: $m / z 248.1140$. Calcd for $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{NO}_{6}: 248.1134$.

To a mixed solution of nitro-diacetate $23(3.64 \mathrm{~g}, 14.7 \mathrm{mmol})$ and TosMIC $(2.866 \mathrm{~g}, 14.7 \mathrm{mmol})$ in $\mathrm{MeCN}(30 \mathrm{~mL})$ under $\mathrm{N}_{2}$, DBU ( $4.6 \mathrm{~mL}, 30.9 \mathrm{mmol}$ ) was added dropwise at $-40^{\circ} \mathrm{C}$, and then, the mixture was allowed to stir for 5 h at room temperature. The mixture was quenched with aqueous $\mathrm{NH}_{4} \mathrm{Cl}$, and then, the solvent was removed under reduced pressure. The residue was partitioned between EtOAc and water, and the organic layer was successively washed with 6 M HCl , a saturated aqueous solution of $\mathrm{NaHCO}_{3}$ and brine, and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was evaporated, and the product 24 was isolated by flash column chromatography $\left(\mathrm{SiO}_{2}\right.$, hexane/EtOAc $\left.=4 / 1, \mathrm{v} / \mathrm{v}\right)$ as an oil in $59 \%$ yield ( 2.47 g ); IR (neat) $3323,2965,2934,2876,1738,1596$, $1548,1494,1455,1383,1365,1316,1302,1241,1175,1140$, $1108,1088,1067,1041,975,934,911,813,706,685 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 1.15(\mathrm{t}, J=7.6 \mathrm{~Hz}, 3 \mathrm{H}), 2.02(\mathrm{~s}$, $3 \mathrm{H}), 2.38(\mathrm{~s}, 3 \mathrm{H}), 2.41(\mathrm{q}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.93(\mathrm{t}, J=7.8 \mathrm{~Hz}$, $2 \mathrm{H}), 4.06(\mathrm{t}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.74(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.27(\mathrm{~d}$, $J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.77(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 9.37$ (brs, 1 H$). \mathrm{HRMS}$ (FAB) $\left(\mathrm{M}^{+}+1\right)$, Found: $m / z 336.1272$. 3-\{(Z)-2-(\{(E)-8-(3-Carboxyethyl)-3-ethyl-9-methyl-2-oxo-1,2,4,5-tetrahydrodipyrrolo[1,2-a:2', $3^{\prime}$-d]azepin-7-yl\}methyl-ene)-4-methyl-5-[(Z)-(4-methyl-5-oxo-3-vinyl-1H-pyrrol-2(5H)-ylidene)methyl]-2H-pyrrol-3-yl\}propanoic acid (3a). To a mixed solution of compound $\mathbf{3 b}(20 \mathrm{mg}, 0.03 \mathrm{mmol})$ and $[\mathrm{Pd}-$ $\left.\left(\mathrm{PPh}_{3}\right)_{4}\right](7 \mathrm{mg}, 0.006 \mathrm{mmol})$ in THF $(1.3 \mathrm{~mL})$, a solution of NaTs $(11 \mathrm{mg}, 0.06 \mathrm{mmol})$ in $\mathrm{MeOH}(1.3 \mathrm{~mL})$ was added at room temperature under $\mathrm{N}_{2}$. After stirring for 10 min , the solvent was evaporated, and the residue was separated by flash column chromatography $\left(\mathrm{SiO}_{2}, \mathrm{CHCl}_{3} / \mathrm{MeOH} / \mathrm{AcOH}=200 / 15 / 1, \mathrm{v} / \mathrm{v} / \mathrm{v}\right)$. The greenish blue fraction was concentrated, and the resulting solid was recrystallized from $\mathrm{CHCl}_{3} /$ hexane to afford free acid $\mathbf{3 a}$ in $42 \%$ yield ( 7 mg ) as a greenish blue solid. Decomposed above $250{ }^{\circ} \mathrm{C}$; IR (KBr) 3418, 2934, 1732, 1697, 1585, 1435, 1272, $1158,1101,959,692 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N}, 400 \mathrm{MHz}\right) \delta 1.11$ $(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}), 2.06(\mathrm{~s}, 6 \mathrm{H}), 2.19(\mathrm{~s}, 3 \mathrm{H}), 2.67(\mathrm{q}, J=7.6 \mathrm{~Hz}$, $2 \mathrm{H}), 2.88(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.97(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.32(\mathrm{t}$, $J=7.3 \mathrm{~Hz}, 4 \mathrm{H}), 3.43(\mathrm{br}, 2 \mathrm{H}), 5.60(\mathrm{~d}, J=11.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.73(\mathrm{~d}$, $J=17.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.36(\mathrm{~s}, 1 \mathrm{H}), 6.38(\mathrm{~s}, 1 \mathrm{H}), 6.78(\mathrm{dd}, J=18.0$, $11.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.62(\mathrm{~s}, 1 \mathrm{H}), 11.14(\mathrm{br}, 1 \mathrm{H})$. Protons of $\mathrm{CO}_{2} \underline{\mathrm{H}}$, one NH , and bridged ethylene were not appeared clearly. UVvis $(\mathrm{MeOH}) \lambda_{\text {max }} 388(\varepsilon=28675), 648(\varepsilon=13100) \mathrm{nm}$; HRMS (FAB) $\left(\mathrm{M}^{+}+1\right)$, Found: $m / z$ 597.2718. Calcd for $\mathrm{C}_{34} \mathrm{H}_{37} \mathrm{~N}_{4} \mathrm{O}_{6}$ : 597.2713.

The present work was financially supported in part by Grant-in-Aid for Scientific Research (B) (No. 15350021) from Japan Society for the Promotion of Science (JSPS).
