#### Abstract

Methoxyindole-3-carbaldehyde is proved to be a versatile electrophile and reacts regioselectively at the 2-position with various types of nucleophiles providing 2-substituted indole-3-carbaldehydes.

Indole is one of the electron rich hetero-aromatics. This is the reason why electrophilic substitution reactions have been well studied ${ }^{2}$ in the indole chemistry (shown in general formula in Scheme 1, A). On the other hand, nucleophilic substitution reaction ${ }^{3}$ was not familiar until we developed 1-hydroxyindole chemistry. ${ }^{4}$ We demonstrated that a hydroxy or a methoxy group at the 1-position of indole skeleton functions as a good leaving group when at least one electron withdrawing group ${ }^{3 b, 4}$ (ester, halogen) ${ }^{3 \mathrm{c}}$ is present in the indole nucleus (Scheme 1, B). Since various types of 1-hydroxy- and 1-methoxyindoles are available, ${ }^{4}$ they can now be utilized as substrates for nucleophilc substitution reactions.
1-Methoxyindole-3-carbaldehyde ${ }^{5}(\mathbf{1}$, Scheme 2$)$ is one of the simplest 1-methoxyindoles and a natural product, isolated from radish as a phytoalexin by Takasugi ${ }^{6}$ and co-workers. They also isolated another phytoalexin, brassicanal A (2), from Chinese cabbage. ${ }^{7}$ Taking these reports into consideration, we

Nucleophilic Substitution Reactions

came up with the idea that plant family Brassicaceae utilizes simple indole-3-carbaldehydes for not only protecting them from diseases and insects, but also promoting their growth. ${ }^{8}$ To examine the idea we needed many kinds of 2 -substituted indole-3-carbaldehydes. In this paper, we wish to report the preparation of them, which are rarely available by electrophilic substitution reactions. Since we have established a rapid and high yield synthetic method ${ }^{4}$ for 1 employing our 1-hydroxyindole chemistry, we chose it as a starting material for nucleophilic substituion reactions.

## I. Reaction of 1 with Sulfur- and Oxygen-Centered Nucleophiles

First of all, we tried potent nucleophiles such as sulfur- and oxygen-centered species and the results are summarized in Scheme 2. As expected, NaSMe reacted with 1 in refluxing MeOH for 2 h to give brassicanal A (2) in $94 \%$ yield. With this simple and successful synthesis of phytoalexin in hand, we next tried the reaction of 1 with NaOMe and NaOEt in refluxing MeOH and EtOH , respectively. The expected 2-methoxy- (3) and 2-ethoxyindole-3-carbaldehyde (4) were obtained in 90 and $95 \%$ yields, respectively. In reactions of $\mathbf{1}$ with sodium salt of ethylene glycol, 1,3-propanediol, glycerol, and $N, N$ dimethylethanol, the yield of the desired product decreased even though longer reaction time was employed. Thus, 5, 6, 7, and $\mathbf{8}$ were obtained in $50,76,30$, and $36 \%$ yields, respectively. 2,2-Dimethyl-1,3-dioxolan-4-methanol also reacted with $\mathbf{1}$ in the presence of Na metal in $\mathrm{N}, \mathrm{N}$-dimethylformamide (DMF) to produce 9 in $57 \%$ yield. Hydrolysis of 9 with aqueous $6 \% \mathrm{HCl}$ at room temperature (rt) afforded 7 in $63 \%$ yield.

## Scheme 2. Reaction of 1 with Sulfur- and Oxygen-Centered Nucleophiles

When 3-methylbut-2-en-1-ol was reacted with 1 at rt for 24 h in the presence of NaH in DMF , the
expected 10a was not obtained. Instead of 10a, a $2: 5$ mixture of 2-oxindoles, 11 and 12, was obtained. Heating a MeOH solution of the mixture at reflux for 24 h transformed $\mathbf{1 2}$ into 11. By carrying out these reactions continually, $\mathbf{1 1}$ was prepared in $75 \%$ yield directly from $\mathbf{1}$.

Since $\mathbf{1 2}$ is an unstable intermediate, its isolation as pure compound was not successful. However, ${ }^{1} \mathrm{H}$ NMR inspection of the crude reaction residue clearly showed the presence of $\mathbf{1 2}$. The mechanism of the formation of $\mathbf{1 1}$ is considered as follows. Initial production of 10a, followed by Claisen rearrangement to give 12, and subsequent liberation of formyl group of $\mathbf{1 2}$ result in the formation of $\mathbf{1 1}$. Similarly, the reaction of $\mathbf{1}$ with potassium salt of 2-methylbut-3-en-2-ol in hexamethylphosphoric triamide (HMPA) produced $26 \%$ yield of $\mathbf{1 3}$ through unstable intermediate $\mathbf{1 0 b}$.

## II. Reaction of 1 with Nitrogen-Centered Nucleophiles

Reactions of $\mathbf{1}$ with nitrogen containing heterocycles were examined in the presence of NaH in DMF at rt and the results are summarized in Scheme 3. Nucleophiles, such as pyrrole, indole, imidazole, and (8aS)hexahydropyrrolo $[1,2-a]$ pyrazine-1,4-dione, afforded the expected products, 14, 15, 16, and $\mathbf{1 7}$ in 99,95 , 80 , and $67 \%$ yields, respectively. In the reaction of $\mathbf{1}$ with benzimidazole, the reaction rate was slow and even after 5 days, the desired $\mathbf{1 8}$ was obtained in only $30 \%$ yield with starting material as the major product ( $62 \%$ ).

The reactions of $\mathbf{1}$ with sodium salts of alicyclic amines are interesting to note. Although $\mathbf{1 9}$ and $\mathbf{2 0}$ were obtained in 71 and $26 \%$ yields in the respective reactions with pyrrolidine and piperidine, a significant amount of $\mathbf{3}$ was generated in both cases in 24 and $63 \%$ yields respectively. The reaction of $\mathbf{1}$ with piperazine provided 21 in $16 \%$ yield together with $48 \%$ yield of 3 . Similar reaction with $N$ methylpiperazine afforded $\mathbf{2 2}$ in $13 \%$ yields in addition to $36 \%$ yield of $\mathbf{3}$.
The formation of $\mathbf{3}$ observed in the reactions utilizing these weak nucleophiles and NaH in DMF may be explained as follows (Scheme 4). The initial reductive cleavage of $N-\mathrm{OMe}$ bond in $\mathbf{1}$ with NaH by a or $\mathbf{b}$ path liberates indole-3-carbaldehyde (23) and MeOH . Hydride reduction of 3-formyl group and the liberation of MeOH is another possible mechanism. Excess NaH instantly convert MeOH into NaOMe . Once NaOMe is generated, it attacks the second molecule of $\mathbf{1}$ giving $\mathbf{3}$ and NaOMe , which in turn attacks the third molecule of $\mathbf{1}$, and infinite repetition of the processes leads to complete transformation of $\mathbf{1}$ to $\mathbf{3}$. In order to examine this explanation, treatment of $\mathbf{1}$ with NaH in DMF at rt was attempted proving the formation of $\mathbf{3}$ as a sole isolable product in $78 \%$ yield, though the formation of $\mathbf{2 3}$ was not detected at all.

The reaction of 1 with $(R)-(-)$-2-pyrrolidinemethanol in the presence of NaH afforded 2-[(R)-2-hydroxymethylpyrrolidin-1-yl]indole-3-carbaldehyde (24) in $14 \%$ yield together with a significant amount ( $23 \%$ ) of unknown compound (MS $m / z: 226\left(\mathrm{M}^{+}\right)$). In the same reaction, treatment of the crude reaction residue with $\mathrm{Ac}_{2} \mathrm{O}$ provided 2-[(R)-2-acetoxymethylpyrrolidin-1-yl]indole-3-carbaldehyde (25)

Scheme 3. Reaction of 1 with Nitrogen-Centered Nucleophiles

 or $\mathbf{b}$ path is possible.

Scheme 5. Reaction of 1 with Carbon-Centered Nucleophiles

in $43 \%$ yield, which was converted to 24 by treatment with aqueous $8 \% \mathrm{NaOH}$ in a quantitative yield.

## III. Reaction of 1 with Carbon-Centered Nucleophiles

As for a carbon nucleophile, we chose KCN at first (Scheme 5). The reaction proceeded smoothly to give $\mathbf{2 6}$ in $98 \%$ yield. The reaction of $\mathbf{1}$ with acetone in the presence of KH in acetone-THF produced the expected 27 together with 28 in 51 and $29 \%$ yields, respectively. On the other hand, when aqueous $8 \%$ NaOH was used as base in acetone- MeOH , nucleophilic substitution reaction did not take place, instead the aldol reaction product (29) was obtained exclusively in $92 \%$ yield. The structure of $\mathbf{2 8}$ was proved through the conversion of $\mathbf{2 9}$ to $\mathbf{2 8}$ in $62 \%$ yield by the reaction with acetone in the presence of KH. Similar results were observed when 3-acetylpyridine was used as a nucleophile. Thus, the reaction of $\mathbf{1}$ in the presence of KH in THF produced $\mathbf{3 0}$ and $\mathbf{3 1}$ in 74 and $9 \%$ yields, respectively.
Dimethyl malonate reacted with $\mathbf{1}$ using NaOMe in refluxing MeOH to give $\mathbf{3 2}$ and $\mathbf{3 3}$ in 46 and $\mathbf{1 3 \%}$ yields, respectively. Treatment of $\mathbf{3 3}$ with NaOMe in refluxing MeOH afforded $\mathbf{3 2}$ in $64 \%$ yield.
When $\mathbf{1}$ was reacted with allyltrimethylsilane in the presence of $\mathrm{Bu}_{4} \mathrm{NF}$ in THF, $\mathbf{3 4}$ and $\mathbf{3 5}$ were obtained in 23 and $28 \%$ yields, respectively. In the similar reaction using (3-methylbut-2-en-1-yl)trimethylsilane, 36, 37, and $\mathbf{3 8}$ were produced in 7,12 , and $14 \%$ yields, respectively.

In conclusion, we have demonstrated that $\mathbf{1}$ is a good electrophile and reacts regioselectively at the 2 position with sulfur-, oxygen-, nitrogen-, and carbon-centered nucleophiles. Consequently, various types of 2-substituted indole-3-carbaldehydes become readily available, which are not accessible by employing electrophilic reactions. With $\mathbf{3 0}$ and $\mathbf{3 2}$ in hand as useful building blocks for the respective synthesis of natural products, goniomitine ${ }^{9}$ ( $\mathbf{3 9}$, Scheme 6) and caulerpin ${ }^{10}(\mathbf{4 0})$, the attempts are now in progress. Biological evaluation of novel 2-substituted indole-3-carbaldehydes reported in this paper is also under investigation as sterilizer and plant growth regulator. ${ }^{8}$

## EXPERIMENTAL

Melting points were determined on a Yanagimoto micro melting point apparatus and are uncorrected. IR spectra were determined with a Shimadzu IR-420 or Horiba FT-720 spectrophotometer, and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra with a JEOL EX-270 or GSX-500 spectrometer with tetramethylsilane as an internal standard. MS spectra were recorded on Hitachi M-80 or JEOL JMS-SX 102A spectrometer. Preparative thin-layer chromatography (p-TLC) was performed on Merck Kiesel-gel $\mathrm{GF}_{245}$ (Type 60) ( $\mathrm{SiO}_{2}$ ). Column
chromatography was performed on silica gel ( $\mathrm{SiO}_{2}, 100-200$ mesh, from Kanto Chemical Co., Inc.) or activated alumina $\left(\mathrm{Al}_{2} \mathrm{O}_{3}, 300\right.$ mesh, from Wako Pure Chemical Industries, Ltd.) throughout the present study.

2-Methylthioindole-3-carbaldehyde (2) from 1-methoxyindole-3-carbaldehyde (1) - An aq. 15\% $\mathrm{NaSMe}(2.5 \mathrm{~mL}, 5.35 \mathrm{mmol})$ was added to a solution of $\mathbf{1}(43.7 \mathrm{mg}, 0.25 \mathrm{mmol})$ in $\mathrm{MeOH}(4 \mathrm{~mL})$ and heated at reflux for 2 h . After evaporation of solvent under reduced pressure, sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$ was added. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was column chromatographed on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}\left(99: 1, \mathrm{v} / \mathrm{v}\right.$ ) to give 2 ( $44.6 \mathrm{mg}, 94 \%$ ). 2: mp 233-234 ${ }^{\circ} \mathrm{C}$ (lit., ${ }^{7} \mathrm{mp} 210-213{ }^{\circ} \mathrm{C}$ colorless prisms, recrystallized from MeOH ). IR (KBr): 1626, 1581, 1447, 1371, 1347, 1225, 848, 755, $657 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right) \delta: 2.68(3 \mathrm{H}, \mathrm{s}), 7.19(1 \mathrm{H}, \mathrm{ddd}, J=7.1,7.0$, and 1.3 Hz$), 7.22(1 \mathrm{H}$, ddd, $J=7.1,7.0$, and 1.5 Hz$), 7.38-7.42(1 \mathrm{H}, \mathrm{m}), 8.04-8.08(1 \mathrm{H}, \mathrm{m}), 10.04(1 \mathrm{H}, \mathrm{s}) . \mathrm{MS} m / z: 191\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{10} \mathrm{H}_{9} \mathrm{NOS}: \mathrm{C}, 62.74 ; \mathrm{H}, 4.74 ; \mathrm{N}, 7.32$. Found: C, 62.61; H, 4.80; N, 7.25.

2-Methoxyindole-3-carbaldehyde (3) from 1 - [General Procedure] (reaction with NaOMe ): Na ( $136.5 \mathrm{mg}, 5.93 \mathrm{mmol}$ ) was added to an ice-cooled anhydrous $\mathrm{MeOH}(2 \mathrm{~mL})$ and stirred at rt for 5 min . To the resultant solution, a solution of $\mathbf{1}(40.1 \mathrm{mg}, 0.23 \mathrm{mmol})$ in anhydrous $\mathrm{MeOH}(1 \mathrm{~mL})$ was added. The mixture was refluxed for 2 h with stirring. After evaporation of solvent under reduced pressure, sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$ was added. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was column chromatographed on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}\left(97: 3\right.$, v/v) to give 3 ( $35.9 \mathrm{mg}, 90 \%$ ). 3: mp 251-252 ${ }^{\circ} \mathrm{C}$ (colorless plates, recrystallized from MeOH ). IR (KBr): 1611, 1583, 1567, 1502, 1345, 1307, 1233, 1058, $745,715 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right) \delta: 4.19(3 \mathrm{H}, \mathrm{s}), 7.13(1 \mathrm{H}$, ddd, $J=6.1,6.0$, and 1.5 Hz$), 7.15(1 \mathrm{H}$, ddd, $J=6.1,6.0$, and 1.5 Hz$), 7.28(1 \mathrm{H}, \mathrm{dd}, J=6.1$ and 1.5 Hz$), 7.95(1 \mathrm{H}, \mathrm{dd}, J=6.1$ and 1.5 Hz$), 9.75(1 \mathrm{H}, \mathrm{s})$. MS $m / z: 175\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{10} \mathrm{H}_{9} \mathrm{NO}_{2}$ : C, 68.56; H, 5.18; N, 8.00. Found: C, 68.42; H, 5.22; N, 7.98. [Second Procedure] (reaction with NaH ): A solution of $\mathbf{1}(32.9 \mathrm{mg}, 0.19 \mathrm{mmol})$ in anhydrous DMF ( 3 mL ) was added to $60 \% \mathrm{NaH}(168.4 \mathrm{mg}, 4.21 \mathrm{mmol})$ and stirred at rt for 17 h . After the same work-up as described in general procedure, $\mathbf{3}(25.8 \mathrm{mg}, 78 \%)$ was obtained.
2-Ethoxyindole-3-carbaldehyde (4) from $\mathbf{1}$ - In the general procedure for 3, Na ( $180.3 \mathrm{mg}, 7.84$ mmol ), anhydrous EtOH ( 2 mL ), and $\mathbf{1}(46.1 \mathrm{mg}, 0.26 \mathrm{mmol})$ in anhydrous $\mathrm{EtOH}(2 \mathrm{~mL})$ were used. After the same work-up and column chromatography, 4 ( $47.2 \mathrm{mg}, 95 \%$ ) was obtained. 4: mp 227-228 ${ }^{\circ} \mathrm{C}$ (decomp., colorless prisms, recrystallized from MeOH). IR (KBr): 1604, 1573, 1485, 1364, 1344, 1234, $1050,743,657 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right) \delta: 1.52(3 \mathrm{H}, \mathrm{t}, J=7.1 \mathrm{~Hz}), 4.47(2 \mathrm{H}, \mathrm{q}, J=7.1 \mathrm{~Hz}), 7.12$ ( 1 H , ddd, $J=7.3,7.2$, and 1.7 Hz ), $7.15(1 \mathrm{H}$, ddd, $J=7.3,7.2$, and 1.5 Hz$), 7.24-7.29(1 \mathrm{H}, \mathrm{m}), 7.93-7.98(1 \mathrm{H}, \mathrm{m})$, $9.75(1 \mathrm{H}, \mathrm{s})$.
