#### Abstract

Simple synthetic method for 4-nitro-1,3,4,5-tetrahydrobenz[ $c d]$ indole (6) is established from indole-3-carboxaldehyde (7). With 6 in hand, various derivatives of 4-amino-, 4-hydroxy- and 4-amino-4-hydroxymethyl-1,3,4,5tetrahydrobenz $[c d]$ indoles become readily available. Bromination of $\mathbf{6}$ afforded useful building blocks for further manipulation. Successful optical resolution of 6 by chiral column chromatography is also reported.

## INTRODUCTION

In recent years, humanity is facing challenges such as the occurrence of food shortage, outbreak of yellow sand and global warming, increasing number of patients with dementia and osteoporosis in an aging society. Hoping to contribute to solve the challenges, we have recently created novel leads for potent root growth promoters, ${ }^{3}$ anti-osteoporosis agents, ${ }^{4} \alpha_{2}$-blockers, ${ }^{5}$ and inhibitors of platelet aggregation. ${ }^{6}$

3

Figure $1 \mathrm{R}, \mathrm{R}^{\mathrm{n}}=$ an appropriate substituent

[^0]In our sequence of challenging study, we have also been much interested in developing biologically active substance for Parkinson's disease. Many research groups are working in this field and various dopamine agonists have been developed. Among them, 4-( $N, N$-diisopropylamino)-1,3,4,5-tetrahydrobenz $[c d]$ indole derivatives ${ }^{7} \mathbf{1}$ seems to be most effective (Figure 1). On the other hand, interesting compounds such as $\mathbf{2},{ }^{8} \mathbf{3},{ }^{9}$ and $\mathbf{4}^{10}$ have been reported and they are expected to have characteristic pharmacological effects.

C

D

Our Target Compounds $R, R^{n}=$ an appropriate substituent

Taking the above compounds into consideration, as possible dopamine agonists and as our targets, we settled 4-amino-1,3,4,5-tetrahydrobenz[ $[d]$ indoles (type A, shown in general formula, Figure 2), 4-amino-1,3,4,5-tetrahydrobenz[cd]indole-4-carboxylic acids (type B), 4- $N$-substituted-4-hydroxymethyl-1,3,4,5-tetrahydrobenz[ $c d]$ indoles (type $\mathbf{C}$ ), and 4-alkoxy-1,3,4,5-tetrahydrobenz[ $c d]$ indoles (type $\mathbf{D}$ ) . Type A has a part of skeleton of ergot alkaloids, ${ }^{11}$ whereas type $\mathbf{B}$ has a conformationally constrained structure ${ }^{12}$ of tryptophans. Therefore, we could expect $\mathbf{B}$ is not only as a dopamine agonist but also as a useful probe to obtain information about the bioactive conformation of a neuropeptide, such as cholecystokinin (CCK), ${ }^{12}$ by incorporating $\mathbf{B}$ into the peptide. Type $\mathbf{C}$ is an analog of a potent dopamine agonist, 4- $\mathrm{N}, \mathrm{N}$-dipropylamino-1,3,4,5-tetrahydrobenz[ $[d]$ indole ${ }^{7,13-15}$ (5, Scheme 1), and type $\mathbf{D}$ is its oxaanalog. To meet our ends, we needed 4-nitro-1,3,4,5-tetrahydrobenz[ $c d]$ indole ${ }^{7,13-15}$ (6) as a common synthetic intermediate.

## RESULTS AND DISCUSSION

Many efforts have been devoted on developing a synthetic method for $\mathbf{6}$. The shortest synthetic route ${ }^{7}$ among thus far known ${ }^{7,13-15}$ is the one through indole-4-carboxaldehyde ${ }^{14}$ using expensive 2 -methyl-3nitrobenzoic acid as a starting material. Nevertheless it still requires nine steps with low overall yield. ${ }^{7}$ On the other hand, we developed a simple four-step synthetic method ${ }^{15}$ for $\mathbf{6}$ from readily available indole-3-carboxaldehyde (7). Furthermore, we succeeded in the syntheses of some of typical target compounds. We also succeeded in the optical resolution of both enantiomers of 6 by chiral column chromatography ${ }^{15}$ aiming at the syntheses of optically active derivatives. This is the full report of
previous communications ${ }^{15, \mathrm{~b}}$ in addition to newly developed bromine containing 4-nitro-1,3,4,5tetrahydrobenz[ $[d]$ indole derivatives, which are useful for further manipulation.

## I. A Simple Four-Step Synthesis of 4-Nitro-1,3,4,5-tetrahydrobenz[cd]indole (6)

We first prepared 4-methoxycarbonylindole-3-carboxaldehyde ${ }^{16 a}$ ( $\mathbf{8 a}$ ) in $53 \%$ yield from 7 according to our one pot procedure. ${ }^{16 a}$ Conversion of $\mathbf{8 a}$ into 4-methoxycarbonyl-3-(2-nitrovinyl)indole (9a) in 91\% yield was attained by aldol reaction with nitromethane. Subsequent reduction of 9 a with $\mathrm{NaBH}_{4}$ in MeOH afforded 4-methoxycarbonyl-3-(2-nitroethyl)indole (10a) in $83 \%$ yield. DIBAL reduction of 10a in THF afforded 4-hydroxymethyl-3-(2-nitroethyl)indole (11) in $99 \%$ yield, nevertheless attempts to convert $\mathbf{9 a}$ directly into $\mathbf{1 1}$ by $\mathrm{LiBH}_{4}$ reduction gave poor results giving $\mathbf{1 0 a}$ and $\mathbf{1 1}$ in $36 \%$ and $33 \%$ yields, respectively.

Though oxidation of $\mathbf{1 1}$ with either active $\mathrm{MnO}_{2}$ or dimethyl sulfoxide-acetic anhydride afforded poor results, pyridinium chlorochromate (PCC) in pyridine produced 3-(2-nitroethyl)indole-4-carboxaldehyde (12) in $32 \%$ yield. Subsequent treatment of $\mathbf{1 2}$ with triethylamine in MeOH at reflux for 1 h afforded $\mathbf{1 3}$ in $87 \%$ yield. Reduction of $\mathbf{1 3}$ cleanly proceeded giving $\mathbf{6}$ in $80 \%$ yield with $\mathrm{NaBH}_{4}$ in MeOH .
Based on our previous findings, ${ }^{16}$ we realized the following one pot synthesis of 4-cyanoindole-3carboxaldehyde ${ }^{16}(\mathbf{8 b})$ from 7. In the first step, by the reaction with thallium tris(trifluoroacetate) ${ }^{17}$ in trifluoroacetic acid (TFA), 7 was derived to (3-formylindol-4-yl)thallium bis-trifluoroacetate, ${ }^{18}$ which was then treated with iodine and cuprous iodide affording 4-iodoindole-3-carboxaldehyde. It was finally converted to $\mathbf{8 b}$ in $72 \%$ overall yield.
Aldol reaction of $\mathbf{8 b}{ }^{16 b}$ with nitromethane afforded nitrovinyl compound ${ }^{16 b} \mathbf{9 b}$ in $88 \%$ yield. Subsequent reduction of $\mathbf{9 b}$ with $\mathrm{NaBH}_{4}$ in MeOH gave nitroethyl compound ${ }^{16 b} \mathbf{1 0 b}$ in $88 \%$ yield. Next, sequential treatment of 10b, initially with diisobutylaluminum hydride (DIBAL) in anhydrous tetrahydrofuran (THF) at reflux for 1 h , then with MeOH -water at reflux for 1 h , was found to produce 1,3 -dihydro- 4 nitrobenz[ $c d]$ indole ( $\mathbf{1 3}$ ) in $61 \%$ yield. Since $\mathbf{1 3}$ was already converted to $\mathbf{6}$ as described above, the attempt at effecting one pot conversion of $\mathbf{1 0 b}$ to $\mathbf{6}$ was readily attained in $55 \%$ yield by adding the $\mathrm{NaBH}_{4}$ reduction procedure to the above DIBAL and MeOH -water treatment of $\mathbf{1 0 b}$. Consequently, a simple four step synthetic method for 6 from 7 with an overall yield of $31 \%$ was established with the originality rate ${ }^{19}$ of $60 \%$. However, every attempt to convert 9b into $\mathbf{6}$ in one pot operation was unsuccessful. Finally, $\mathbf{6}$ was reduced to $\mathbf{1 4}$ with $\mathrm{Zn}(\mathrm{Hg})-\mathrm{aq} . \mathrm{HCl}$ in MeOH at reflux in $99 \%$ yield.
$N$-Substituted derivatives of $\mathbf{1 4}$ were prepared as follows. Treatments of $\mathbf{1 4}$ with benzoyl chloride and phenylacetyl chloride in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ afforded amide compounds, $\mathbf{1 5 a}$ and $\mathbf{1 5 b}$, in $80 \%$ and $\mathbf{7 3 \%}$ yields, respectively. The reaction of $\mathbf{1 4}$ with phenethyl bromide in the presence of KI and $\mathrm{K}_{2} \mathrm{CO}_{3}$ as a base provided 15 c in $61 \%$ yield. Excess amount of propyl iodide converted 14 to N -propyl compound 15d and $N, N$-dipropyl compound $\mathbf{5}$ in $4 \%$ and $87 \%$ yields, respectively, in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$. In addition, the compound 5 was derived from 15d in $80 \%$ yield by the reaction with propyl iodide in MeCN in the presence of $n-\mathrm{Bu}_{4} \mathrm{NBr}$ and $\mathrm{K}_{2} \mathrm{CO}_{3}$.
Now that $\mathbf{6}$ is readily available from $7{ }^{15 b} \mathbf{6}$ was converted to $\mathbf{1 6}$ by the procedure of Kruse and coworker ${ }^{6,7}$ in $81 \%$ yield (Scheme 2). Since 16 is known to isomerize to 1,2-dihydro-4hydroxybenz $[c d]$ indole having stabler naphthalene skeleton than indole isomer, ${ }^{6,7}$ Bucherer reaction of 16 was investigated under careful control of reaction conditions using $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}$ and KCN . The results were the formation of $\alpha$-aminonitrile 17 and spiro-hydantoin derivative 18 in $11 \%$ and $59 \%$ yields, respectively. While, Strecker type reaction of 16 with $\mathrm{NH}_{4} \mathrm{Cl}$ and KCN produced 17 as major product (56\%) together with $10 \%$ yield of 19a. Although 19a was a crystalline solid, it was unstable and gradually changed back to 16 . Isolation of stable 4 -acetoxy-4-cyano compound (19b) in $43 \%$ yield by the
treatment of $\mathbf{1 6}$ with KCN in AcOH , followed by the reaction of the resulting $\mathbf{1 9 a}$ with $\mathrm{Ac}_{2} \mathrm{O}$ and

pyridine, clearly established the structure of 19a. Next, $\mathbf{1 7}$ was converted to amide $\mathbf{2 0}$ in $84 \%$ yield by the reaction with $8 \% \mathrm{NaOH}$ in the presence of $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$. Subsequent hydrolysis of $\mathbf{2 0}$ with $8 \% \mathrm{NaOH}$ in MeOH produced the desired type $\mathbf{B}$ amino acid 21 in a quantitative yield.

For the synthesis of the type $\mathbf{C}$ target compounds, $\mathbf{6}$ was initially treated with KOt - Bu and then with $37 \%$ formalin to afford 22a in 73\% yield. Treatment of 22a with $\mathrm{Ac}_{2} \mathrm{O}$ provided 22b in 98\% yield. Reduction of 22a with $\mathrm{Zn}(\mathrm{Hg})-\mathrm{aq} . \mathrm{HCl}$ gave 23a in $94 \%$ yield.
Treatment of 23a with $\mathrm{Ac}_{2} \mathrm{O}$ afforded $N$-acetyl compound 23b in $98 \%$ yield. Subsequent oxidation of $\mathbf{2 3 b}$ with $\mathrm{Ac}_{2} \mathrm{O}-$ DMSO produced $\mathbf{2 4} \mathbf{a}$ and $\mathbf{2 4 b}$ in $32 \%$ and $56 \%$ yields, respectively. The reaction of $\mathbf{2 4 b}$ with hydroxylamine afforded oxime derivative $\mathbf{2 4} \mathbf{c}$ as a single isomer in $95 \%$ yield. Further treatment of 24c with $\mathrm{Ac}_{2} \mathrm{O}$ at reflux produced $52 \%$ yield of 4-acetylamino-4-cyano-1,3,4,5-tetrahydrobenz[ $\left.c d\right]$ indole (24d), which was alternatively produced by the reaction of 17 with $\mathrm{Ac}_{2} \mathrm{O}$ in $61 \%$ yield. The reaction of 23a with propyl iodide ( 2 equiv.) in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ produced the mono-propyl 25 and the target compound 27a in 87 and $6 \%$ yields, respectively. Although under similar reaction conditions, the longer reaction time improved the yield of $\mathbf{2 7 a}$ to $53 \%$, various attempts at realizing exclusive production of 27a were unsuccessful. While, treatment of $\mathbf{2 5}$ with propionyl chloride afforded 26a and 26b in 89 and $8 \%$ yields, respectively. Subsequent reduction of 26a with $\mathrm{LiAlH}_{4}$ afforded 27a in $91 \%$ yield. Acetylation of $\mathbf{2 7 a}$ with $\mathrm{Ac}_{2} \mathrm{O}$ afforded $99 \%$ yield of $\mathbf{2 7 b}$.

The type $\mathbf{D}$ target compound was produced as follows. Reduction of $\mathbf{1 6}$ with $\mathrm{NaBH}_{4}$ afforded 4-hydroxy-1,3,4,5-tetrahydrobenz[ $c d]$ indole (28a) in $99 \%$ yield. Treatment of 28a with NaH in DMF, and then with propyl iodide produced 1-propyl compound 28b in $96 \%$ yield. The structural proof was obtained through conversion of $\mathbf{2 8 b}$ into $\mathbf{2 8 c}$ in $75 \%$ yield by the reaction with $\mathrm{Ac}_{2} \mathrm{O}$. Thus, comparison of ${ }^{1} \mathrm{H}-\mathrm{NMR}$ data of 28b and 28c demonstrated that the $C(4)$-proton attached to 4-hydroxy group of $\mathbf{2 8 b}$ shifted to lower magnetic field by ca. 1 ppm in the spectrum of $\mathbf{2 8 c}$. The fact clearly proved that hydroxy group was acetylated.

Successive treatment of 28a with NaH in DMF, and then with tosyl chloride produced $N$-tosyl (29a) and $N, O$-ditosyl compound (29b) in 37 and $27 \%$ yields, respectively, together with $34 \%$ recovery of unreacted starting material. Treatment of 29a with KH in DMF, and then with propyl iodide afforded $47 \%$ yield of the 4-propyloxy compound (30a), which was successfully converted to $\mathbf{3 0 b}$ in $86 \%$ yield by hydrolysis with $8 \% \mathrm{NaOH}$.

## II. Preparation of Bromine Containing Derivatives

It is well known that the introduction of bromine atom into 2 position of ergot alkaloids ${ }^{11}$ increases their biological activity. In addition, organometallic chemistry makes it possible to convert $\mathrm{C}-\mathrm{Br}$ bond to $\mathrm{C}-\mathrm{C}, \mathrm{C}-\mathrm{N}, \mathrm{C}-\mathrm{O}$ bonds, etc., for example by employing Heck reaction, ${ }^{20}$ Stille reaction, ${ }^{21}$ and so on. Based on the facts, we tried to introduce bromine atom into the 1,3,4,5-tetrahydrobenz[ $c d]$ indole
skeleton.

$+$
$+$

38

39
Scheme 3

The reaction of $\mathbf{6}$ with NBS in the presence of AIBN proceeded cleanly to afford $\mathbf{3 1}$ in $87 \%$ yield (Scheme 3). Further treatment of $\mathbf{3 1}$ with NBS produced unstable intermediate that is deduced to be 2,2a-dibromo-4-nitro-2a,3,4,5-tetrahydrobenz[ $c d]$ indole $(\mathbf{E})$. Therefore, after bromination of $\mathbf{3 1}$ with NBS, the whole was irradiated with 100 W mercury lamp in an aim to convert $\mathbf{E}$ to stable product. As a result, 2,6-
(32), 2,8- (33), and 2,7-dibromo-4-nitro-1,3,4,5-tetrahydrobenz[ $c d]$ indole (34) were produced in the respective yields of $36 \%, 2 \%$, and $14 \%$ together with unreacted $31(9 \%)$.
Both compounds, $\mathbf{3 2}$ and $\mathbf{3 3}$, have a pair of ortho-coupled aromatic protons in their ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra.
Therefore, one of them is a 2,6-dibromo and the other is a 2,8-dibromo compound. The conversion of $\mathbf{3 2}$ into 1 -acetyl derivative (35) in $62 \%$ yield by the reaction with $\mathrm{Ac}_{2} \mathrm{O}$ proved its structure to be 2,6dibromo compound. Thus, comparison of ${ }^{1} \mathrm{H}-\mathrm{NMR}$ data of $\mathbf{3 2}$ and $\mathbf{3 5}$ demonstrated that an ortho-coupled $\mathrm{C}(8)$-proton of $\mathbf{3 2}$ shifted to lower magnetic field by ca. 1 ppm by the anisotropy effect of the introduced 1 -acetyl group of $\mathbf{3 5}$, proving their assigned structures. In addition, the failure to introduce an acetyl group into the 1-position of $\mathbf{3 3}$ with $\mathrm{Ac}_{2} \mathrm{O}$ even under forced conditions confirmed its assigned structure because steric hindrance between $\mathrm{C}(8)$-bromine atom and 1-acetyl group would explain the results. Similarly, bromination of 22a with NBS in the presence of AIBN cleanly afforded $\mathbf{3 6}$ in $92 \%$ yield. As in the case of $\mathbf{3 1}$, further bromination of $\mathbf{3 6}$ with NBS produced unstable intermediate which is deduced to be 2,2a-dibromo-4-hydroxymethyl-4-nitro-2a,3,4,5-tetrahydrobenz[cd]indole (F). Therefore, after bromination of $\mathbf{3 6}$ with NBS, the whole was irradiated with 100 W mercury lamp in an aim to convert $\mathbf{F}$ to stable product. Furthermore the reaction mixture was acetylated by $\mathrm{Ac}_{2} \mathrm{O}-$ pyridine for enabling easy separation of products. As a result, 2,6-dibromo- (37a) 1-acetyl-2,6-dibromo- (37b), 2-bromo- (38), 2,8-dibromo- (39), and 2,7-dibromo-4-acetoxymethyl-4-nitro-1,3,4,5-tetrahydrobenz[ $c d]$ indole (40) were produced in $14 \%, 14 \%, 2 \%, 5 \%$, and $2 \%$ yields, respectively.
Acetylation of $\mathbf{3 7 a}$ with $\mathrm{Ac}_{2} \mathrm{O}$-pyridine afforded $\mathbf{3 7 b}$ in $80 \%$ yields. As in the case of $\mathbf{3 2}$ and $\mathbf{3 5}, \mathbf{3 7 a}$ and 37b showed the anisotropy effect on their $\mathrm{C}(8)$ protons by the introduced 1 -acetyl group proving the assigned structures. Proof of the structure of $\mathbf{3 8}$ was obtained by its production in $98 \%$ yield from $\mathbf{3 6}$ by the acetylation with $\mathrm{Ac}_{2} \mathrm{O}$. The structure of $\mathbf{4 0}$ was established by alternative synthesis. First, hydroxymethylation of $\mathbf{3 4}$ to $\mathbf{4 1}$ was carried out in $60 \%$ yield by the treatment with $37 \%$ formalin in the presence of KOt-Bu. Subsequent acetylation of $\mathbf{4 1}$ with $\mathrm{Ac}_{2} \mathrm{O}$-pyridine afforded $74 \%$ yield of $\mathbf{4 0}$ which was identical with the one obtained by the bromination of $\mathbf{3 6}$.

## III. Optical Resolution ${ }^{15 \mathrm{sa}}$ of 4-Nitro-1,3,4,5-tetrahydrobenz[ $c d$ ]indole (6)

With the desired compound $\mathbf{6}$ in hand, we next tried its optical resolution on semi-preparative chiral column chromatography, and finally found that optical isomers of $\mathbf{6}$ were separable as shown in Chart 1 on Chiralpak AS column (Daicel Kagaku) using hexane-isopropanol ( $18: 1, \mathrm{v} / \mathrm{v}$ ) as an eluent. Syntheses of optically active derivatives of (+)-6 and (-)-6 are currently under investigation.

## EXPERIMENTAL

Melting points were determined on a Yanagimoto micro melting point apparatus and are uncorrected. Infrared (IR) spectra were determined with a Shimadzu IR-420 spectrophotometer, and proton nuclear magnetic resonance ( $\left.{ }^{1} \mathrm{H}-\mathrm{NMR}\right)$ spectra with a JEOL JNM-GSX 500 or FX100S spectrometer with tetramethylsilane as an internal standard. Mass spectra (MS) were recorded on a Hitachi M-80 spectrometer. Preparative thin-layer chromatography (p-TLC) was performed on Merck Kiesel-gel GF 254 (Type 60 ) $\left(\mathrm{SiO}_{2}\right)$. Column chromatography was performed on silica gel ( $\mathrm{SiO}_{2}, 100-200$ mesh, from Kanto Chemical Co. Inc.) throughout the present study.
4-Cyanoindole-3-carboxaldehyde (8b) ${ }^{16 a, b}$ from Indole-3-carboxaldehyde (7) — Compound 7 (101.6 $\mathrm{mg}, 0.70 \mathrm{mmol}$ ) was added to a solution of $\mathrm{Tl}\left(\mathrm{OCOCF}_{3}\right)_{3}$ in TFA ( $1.0 \mathrm{~mL}, 1.2 \mathrm{~mol} \mathrm{eq}$ ) and stirred at rt for 22.5 h . After evaporation of the solvent, DMF ( 5.0 mL ) was added. To the resultant solution, CuI ( $335.7 \mathrm{mg}, 1.76 \mathrm{mmol}$ ) and $\mathrm{I}_{2}(633.0 \mathrm{mg}, 2.49 \mathrm{mmol})$ were added and stirred at rt for 1 h . Then, CuCN ( $253.8 \mathrm{mg}, 2.83 \mathrm{mmol}$ ) was added and heated at $64-71^{\circ} \mathrm{C}$ for 1 h under ultrasonic bath. Solids were filtered off through thin $\mathrm{SiO}_{2}$ layer. They were washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(9: 1, \mathrm{v} / \mathrm{v})$. To the combined mixture of washings and the filtrate was added $\mathrm{H}_{2} \mathrm{O}$. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(9: 1$, $\mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was subjected to column-chromatography on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(99: 1, \mathrm{v} / \mathrm{v})$ as an eluent to give $\mathbf{8 b}(85.3 \mathrm{mg}, 72 \%)$. Spectral data of $\mathbf{8 b}$ are reported in the reference 16 b .
Methyl 3-(2-nitrovinyl)indole-4-carboxylate (9a) from Methyl 3-formylindole-4-carboxylate (8a) Dried $\mathrm{NH}_{4} \mathrm{OAc}(33.6 \mathrm{mg}, 0.44 \mathrm{mmol})$ was added to a solution of $\mathbf{8 a}{ }^{16 \mathrm{a}}(128.2 \mathrm{mg}, 0.63 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{NO}_{2}$ $(10.0 \mathrm{~mL})$ and heated at $90-95{ }^{\circ} \mathrm{C}$ for 4 h with stirring. After evaporation of the solvent under reduced pressure, $\mathrm{H}_{2} \mathrm{O}$ was added. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave crystalline solid. Recrystallization from $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ afforded $\mathbf{9 a}$ ( 104.2 mg ). Evaporation of the mother liquor leaved an oil, which was subjected to column-chromatography on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$ as an eluent to give additional $9 \mathbf{a}(37.3 \mathrm{mg})$. Total yield of $\mathbf{9 a}$ was $141.5 \mathrm{mg}(91 \%) .9 \mathrm{a}: \mathrm{mp} 121-122{ }^{\circ} \mathrm{C}$ (red prisms, recrystallized from $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ ). IR ( KBr ): $3240,1718,1602,1252 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}$ (pyridine- $d_{5}$ ) $\delta: 3.92(3 \mathrm{H}, \mathrm{s}), 7.27(1 \mathrm{H}, \mathrm{t}, J=8.0 \mathrm{~Hz}), 7.73(1 \mathrm{H}, \mathrm{dd}, J=8.0,1.0 \mathrm{~Hz}), 7.96(1 \mathrm{H}, \mathrm{d}, J=13.5 \mathrm{~Hz}), 8.00(1 \mathrm{H}$, dd, $J=8.0,1.0 \mathrm{~Hz}), 8.35(1 \mathrm{H}, \mathrm{br} \mathrm{s}), 9.69(1 \mathrm{H}, \mathrm{dd}, J=13.5,0.5 \mathrm{~Hz})$. MS m/z: $246\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C, $58.53 ; \mathrm{H}, 4.09 ; \mathrm{N}, 11.38$. Found: C, $58.37 ; \mathrm{H}, 3.92 ; \mathrm{N}, 11.29$.

4-Cyano-3-(2-nitrovinyl)indole (9b) from (8b) - Dried $\mathrm{NH}_{4} \mathrm{OAc}(201.3 \mathrm{mg}, 2.53 \mathrm{mmol})$ was added to a solution of $\mathbf{8 b}(537.7 \mathrm{mg}, 3.16 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{NO}_{2}(30.0 \mathrm{~mL})$ and heated at $110-115{ }^{\circ} \mathrm{C}$ for 2 h with stirring. After evaporation of the solvent, formed crystals were filtrated. Crystals were washed with $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(1: 1, \mathrm{v} / \mathrm{v}, 120.0 \mathrm{~mL})$ to give 9b $(569.7 \mathrm{mg})$. After condensation of mother liquor under
reduced pressure, the whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave crystalline solid, which was subjected to column-chromatography on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$ ( $95: 5$, v/v) as an eluent to give additional 9b ( 20.2 mg ). Total yield of $\mathbf{9 b}$ was $589.9 \mathrm{mg}(88 \%)$. Spectral data of $\mathbf{9 b}$ are reported in the reference 16b.

Methyl 3-(2-Nitroethyl)indole-4-carboxylate (10a) from 9a - $\mathrm{NaBH}_{4}$ ( $36.8 \mathrm{mg}, 0.97 \mathrm{mmol}$ ) was added to a solution of $\mathbf{9 a}(29.5 \mathrm{mg}, 0.12 \mathrm{mmol})$ in $\mathrm{MeOH}(10.0 \mathrm{~mL})$ and stirred at rt for 15 min . After addition of $\mathrm{H}_{2} \mathrm{O}$, the mixture was adjusted to pH 1 by adding $3 \% \mathrm{HCl}$. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure. The residue was purified by column chromatography on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as an eluent to give $\mathbf{1 0 a}$ (24.6 $\mathrm{mg}, 83 \%$ ). 10a: mp $106-107{ }^{\circ} \mathrm{C}$ (colorless prisms, recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}-$ hexane). IR ( KBr ): 3330, 1697, 1547, 1263, $1205 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 3.65(2 \mathrm{H}, \mathrm{t}, J=7.0 \mathrm{~Hz}), 3.93(3 \mathrm{H}, \mathrm{s}), 4.68(2 \mathrm{H}, \mathrm{t}, J=7.0$ $\mathrm{Hz}), 7.14(1 \mathrm{H}, \mathrm{br}$ s), $7.17(1 \mathrm{H}, \mathrm{t}, J=7.5 \mathrm{~Hz}), 7.54(1 \mathrm{H}, \mathrm{dd}, J=7.5,1.0 \mathrm{~Hz}), 7.79(1 \mathrm{H}, \mathrm{dd}, J=7.5,1.0 \mathrm{~Hz})$, $8.28(1 \mathrm{H}, \mathrm{br} s)$. MS m/z: $248\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C, 58.06; H, 4.87; N, 11.29. Found: C, 57.86; H, 4.87; N, 11.26.

4-Cyano-3-(2-nitroethyl)indole (10b) from 9b - $\mathrm{NaBH}_{4}(20.2 \mathrm{mg}, 0.54 \mathrm{mmol})$ was added to a solution of $\mathbf{9 b}(20.5 \mathrm{mg}, 0.10 \mathrm{mmol})$ in $\mathrm{MeOH}(4.0 \mathrm{~mL})$ and stirred at rt for 0.5 h . After addition of $\mathrm{H}_{2} \mathrm{O}$, the mixture was adjusted to pH 5 by adding $0.6 \% \mathrm{HCl}$. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure. The residue was subjected to p-TLC on $\mathrm{SiO}_{2}$ with EtOAc-hexane (1:1, v/v) as a developing solvent. Extraction of the band having an $R f$ value of $0.67-0.57$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5$, v/v) gave $\mathbf{1 0 b}$ ( $17.3 \mathrm{mg}, 88 \%$ ). Spectral data of $\mathbf{1 0 b}$ are reported in the reference $16 b$.
4-Hydroxymethyl-3-(2-nitroethyl)indole (11) from 10a - DIBAL (1.0 M toluene, $1.6 \mathrm{~mL}, 1.63$ mmol ) was added to a cooled solution of $\mathbf{1 0 a}(133.9 \mathrm{mg}, 0.54 \mathrm{mmol})$ in dry THF ( 5.0 mL ) under Ar atmosphere and the mixture was stirred at rt for 3 h . After addition of MeOH and $10 \%$ aq. solution of Rochelle salt, the whole was adjusted to pH 3 by addition of $0.6 \% \mathrm{HCl}$. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$ as an eluent to give 11 ( $118.7 \mathrm{mg}, 99 \%$ ). 11: mp 118- $119{ }^{\circ} \mathrm{C}$ (colorless prisms, recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane). IR (KBr): 3560, 3320, 1558, 1378, 990, $747 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 3.69(2 \mathrm{H}, \mathrm{t}, J=7.0 \mathrm{~Hz}), 4.75(2 \mathrm{H}, \mathrm{t}$, $J=7.0 \mathrm{~Hz}), 4.97(2 \mathrm{H}, \mathrm{s}), 7.03(1 \mathrm{H}, \mathrm{dd}, J=7.0,2.0 \mathrm{~Hz}), 7.15(1 \mathrm{H}, \mathrm{t}, J=7.0 \mathrm{~Hz}), 7.23(1 \mathrm{H}, \mathrm{s}), 7.36(1 \mathrm{H}, \mathrm{dd}$, $J=7.0,2.0 \mathrm{~Hz}), 8.15(1 \mathrm{H}, \mathrm{br} s) . \mathrm{MS} m / z: 220\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{3}: \mathrm{C}, 59.99 ; \mathrm{H}, 5.49 ; \mathrm{N}$, 12.72. Found: C, 59.85; H, 5.46; N, 12.61.

11 from 9a - I.iRH. ( 29.9 mo .1 .36 mmol ) was added to a solıtion of 9a ( 30.8 mog 0.13 mmol ) in THF
( 3 mL ) and stirred at rt for 30 min , then at reflux for 1 h . After addition of $\mathrm{H}_{2} \mathrm{O}$, the mixture was made acidic by adding $0.6 \% \mathrm{HCl}$. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure. The residue was subjected to p-TLC on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(98: 2, \mathrm{v} / \mathrm{v})$ as a developing solvent. Extraction of the bands having an $R f$ value of $0.68-0.36$ and $0.34-0.24$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$ gave $\mathbf{1 0 a}(11.1 \mathrm{mg}$, $36 \%)$ and $\mathbf{1 1}$ ( $9.1 \mathrm{mg}, 33 \%$ ), respectively.
3-(2-Nitroethyl)indole-4-carboxaldehyde (12) from 11 — PCC ( $66.9 \mathrm{mg}, 0.31 \mathrm{mmol}$ ) was added to a solution of $\mathbf{1 1}(34.6 \mathrm{mg}, 0.16 \mathrm{mmol})$ in pyridine ( 2 mL ) and stirred at rt for 2.5 h . EtOH ( 0.2 mL ) was then added and stirred for 30 min . After addition of $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$, the precipitates were filtered off through thin $\mathrm{SiO}_{2}$ layer. Evaporation of the filtrate under reduced pressure leaves an oil, which was column-chromatographed on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(98: 2, \mathrm{v} / \mathrm{v})$ as an eluent. The early fractions afforded $\mathbf{1 2}(11.0 \mathrm{mg}, 32 \%)$. The middle fractions gave 4.5 mg of unknown product (expected to be a mixture of diastereoisomers of 5-hydroxy-4-nitro-1,3,4,5-tetrahydrobenz[ $c d]$ indole from MS and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The later fractions afforded unreacted $11(4.7 \mathrm{mg}, 14 \%)$. 12: mp $159-160{ }^{\circ} \mathrm{C}$ (red prisms, recrystallized from $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ ). IR ( KBr ): $3185,1674,1538 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(10 \% \mathrm{CD}_{3} \mathrm{OD}\right.$ in $\left.\mathrm{CDCl}_{3}\right) \delta$ : $3.73(2 \mathrm{H}, \mathrm{t}, J=6.5 \mathrm{~Hz}), 4.61(2 \mathrm{H}, \mathrm{t}, J=6.5 \mathrm{~Hz}), 6.92-7.72(4 \mathrm{H}, \mathrm{m}), 10.01(1 \mathrm{H}, \mathrm{s}) . \mathrm{MS} \mathrm{m} / \mathrm{z}: 218\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{3}$ : C, 60.54; H, 4.62; N, 12.84. Found: C, 60.30; H, 4.33; N, 12.45.

4-Nitro-1,3-dihydrobenz[ $\boldsymbol{c} \boldsymbol{d}]$ indole (13) from $\mathbf{1 2}$ - A solution of $\mathbf{1 2}$ ( $6.7 \mathrm{mg}, 0.03 \mathrm{mmol}$ ) in a mixture of $\mathrm{Et}_{3} \mathrm{~N}(0.5 \mathrm{~mL})$ and $\mathrm{MeOH}(2 \mathrm{~mL})$ was refluxed for 1 h . After evaporation of solvent under reduced pressure, $\mathrm{H}_{2} \mathrm{O}$ was added. The mixture was adjusted to pH 4.0 by adding $0.6 \% \mathrm{HCl}$. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure. The residue was purified by column-chromatography on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as an eluent to give $\mathbf{1 3}$ ( $5.4 \mathrm{mg}, 87 \%$ ).13: $\mathrm{mp} 190-190.5^{\circ} \mathrm{C}$ (red prisms, recrystallized from $\left.\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}\right)$. IR ( KBr ): 3356, 1574, 1491, $1290 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 4.33(2 \mathrm{H}, \mathrm{br} \mathrm{s}), 7.01(1 \mathrm{H}, \mathrm{dd}$, $J=7.0,2.0 \mathrm{~Hz}), 7.03(1 \mathrm{H}, \mathrm{s}), 7.10(1 \mathrm{H}, \mathrm{t}, J=7.0 \mathrm{~Hz}), 7.19(1 \mathrm{H}, \mathrm{dd}, J=7.0,2.0 \mathrm{~Hz}), 8.09(2 \mathrm{H}, \mathrm{br} \mathrm{s}) . \mathrm{MS} \mathrm{m} / \mathrm{z}:$ $200\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{11} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{2}$ : C, 66.00; H, 4.03; N, 13.99. Found: C, 65.94; H, 4.15; N, 13.90.
4-Nitro-1,3,4,5-tetrahydrobenz[ $\boldsymbol{c} \boldsymbol{d}]$ indole (6) from $\mathbf{1 3}$ - $\mathrm{NaBH}_{4}(19.1 \mathrm{mg}, 0.50 \mathrm{mmol})$ was added to a solution of $\mathbf{1 3}(22.0 \mathrm{mg}, 0.10 \mathrm{mmol})$ in $\mathrm{MeOH}(4 \mathrm{~mL})$ and stirred at rt for 0.5 h . After addition of $\mathrm{H}_{2} \mathrm{O}$, the mixture was made acidic by adding a drop of $\mathrm{AcOH}-\mathrm{H}_{2} \mathrm{O}(1: 1, \mathrm{v} / \mathrm{v})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure. The residue was purified by column chromatography on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane ( $2: 1, \mathrm{v} / \mathrm{v}$ ) as an eluent to give $\mathbf{6}$ ( $17.8 \mathrm{mg}, 80 \%$ ). 6: $\mathrm{mp} 138.5-139^{\circ} \mathrm{C}$ ( $\mathrm{lit.}^{7} \mathrm{mp} 134-135^{\circ} \mathrm{C}$ ). All spectral data were identical with those of 6 reported by L. I. Kruse et al. ${ }^{7}$

4-Nitro-1,3-dihydrobenz[ $\boldsymbol{c} \boldsymbol{d}]$ indole (13) from (10b) — DIBAL ( 1.0 M toluene, $1.6 \mathrm{~mL}, 1.63 \mathrm{mmol}$ ) was added to a cooled solution of $\mathbf{1 0 b}(58.1 \mathrm{mg}, 0.27 \mathrm{mmol})$ in dry THF $(1.0 \mathrm{~mL})$ under Ar atmosphere and the mixture was heated at reflux for 1 h . Then, $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(2: 1, \mathrm{v} / \mathrm{v}, 1.5 \mathrm{~mL})$ was added and the whole was refluxed for 1 h . After addition of MeOH and $10 \% \mathrm{aq}$. solution of Rochelle salt, the whole was adjusted to pH 3 by addition of $0.6 \% \mathrm{HCl}$. The whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(95: 5, \mathrm{v} / \mathrm{v})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give $\mathbf{1 3}$ ( $33.5 \mathrm{mg}, 61 \%$ ).
4-Nitro-1,3,4,5-tetrahydrobenz[ $\boldsymbol{c d}]$ indole (6) from (10b) - One Pot Synthesis : DIBAL (1.0 M toluene, $2.90 \mathrm{~mL}, 2.94 \mathrm{mmol}$ ) was added to a cooled solution of $\mathbf{1 0 b}(104.2 \mathrm{mg}, 0.49 \mathrm{mmol})$ in dry THF $(3.0 \mathrm{~mL})$ under Ar atmosphere and the mixture was stirred at rt for 1 h . Then, $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(2: 1, \mathrm{v} / \mathrm{v}, 5.0$ mL ) was added and the whole was refluxed for 1 h . After cooling, DMF ( 1.0 mL ) and $\mathrm{NaBH}_{4}$ ( 183.5 mg , 4.83 mmol ) were added and the mixture was stirred at rt for 20 min . After addition of MeOH , the whole was adjusted to pH 4 by addition of $\mathrm{AcOH}-\mathrm{H}_{2} \mathrm{O}(1: 1, \mathrm{v} / \mathrm{v})$. The whole was extracted with EtOAc. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane ( $2: 1, \mathrm{v} / \mathrm{v}$ ) to give 6 ( $53.7 \mathrm{mg}, 55 \%$ ).
4-Amino-1,3,4,5-tetrahydrobenz[ $[d]$ indole (14) from $6-6 \% \mathrm{HCl}(1 \mathrm{~mL})$ was added to a mixture of Zn powder $(472.2 \mathrm{mg}, 7.27 \mathrm{mmol})$ and $\mathrm{HgCl}_{2}(43.9 \mathrm{mg}, 0.16 \mathrm{mmol})$ and stirred for 5 min . Liquid was decanted off. To the residue was added a solution of $\mathbf{6}(30.3 \mathrm{mg}, 0.15 \mathrm{mmol})$ in $\mathrm{MeOH}(3 \mathrm{~mL})$ and then $6 \% \mathrm{HCl}(1.5 \mathrm{~mL})$. The whole was heated at reflux for 3 h with stirring. After filtering off the solid, $8 \%$ NaOH was added to make the whole alkaline. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was subjected to p-TLC on $\mathrm{SiO}_{2}$ with $\mathrm{CHCl}_{3}-\mathrm{MeOH}-\mathrm{aq} .30 \% \mathrm{NH}_{3}(46: 5: 0.5$, v/v) as a developing solvent. Extraction of the band having an $R f$ value of $0.50-0.21$ with $\mathrm{CHCl}_{3}-\mathrm{MeOH}-30 \%$ aq. $\mathrm{NH}_{3}$ (46: 5:0.5, $\mathrm{v} / \mathrm{v}$ ) afforded 14 ( $25.6 \mathrm{mg}, 99 \%$ ). 14: $\mathrm{mp} 129.5-130{ }^{\circ} \mathrm{C}$ (lit. ${ }^{7} \mathrm{mp} 119-121{ }^{\circ} \mathrm{C}$ ) colorless prisms, recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane). IR ( KBr ): $3328,3072,2912,1612,1603,1582,1443,1344,1261$, 1097, 1058, 937, $746 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(5 \% \mathrm{CD}_{3} \mathrm{OD}\right.$ in $\left.\mathrm{CDCl}_{3}\right) \delta: 2.74(1 \mathrm{H}, \mathrm{dd}, J=15.6,7.8 \mathrm{~Hz}), 2.86(1 \mathrm{H}$, dd, $J=15.6,7.8 \mathrm{~Hz}), 3.12(1 \mathrm{H}, \mathrm{dd}, J=15.6,3.9 \mathrm{~Hz}), 3.15(1 \mathrm{H}, \mathrm{dd}, J=15.6,3.9 \mathrm{~Hz}), 3.54(1 \mathrm{H}$, sept, $J=3.9$ $\mathrm{Hz}), 6.84(1 \mathrm{H}, \mathrm{d}, J=7.5 \mathrm{~Hz}), 6.89(1 \mathrm{H}, \mathrm{s}), 7.12(1 \mathrm{H}, \mathrm{t}, J=7.5 \mathrm{~Hz}), 7.17(1 \mathrm{H}, \mathrm{d}, J=7.5 \mathrm{~Hz}) . \mathrm{MS} m / z: 172$ $\left(\mathrm{M}^{+}\right)$. 37b from $\mathbf{3 7 a}$ - $\mathrm{Ac}_{2} \mathrm{O}(1 \mathrm{~mL})$ was added to a solution of $\mathbf{3 7 a}(33.1 \mathrm{mg}, 0.08 \mathrm{mmol})$ in pyridine ( 2 mL ) and the whole was stirred at rt for 1 h . After evaporation of the solvent under reduced pressure, the residue was subjected to p -TLC on $\mathrm{SiO}_{2}$ with acetone-hexane (2:5, v/v) as a developing solvent. Extraction of the band having an $R f$ value of $0.80-0.71$ with EtOAc afforded $\mathbf{3 7 b}$ ( $28.8 \mathrm{mg}, 80 \%$ ).

38 from $36-\mathrm{Ac}_{2} \mathrm{O}(0.5 \mathrm{~mL})$ was added to a solution of 36 ( $50.6 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) in pyridine ( 1 mL ) and the whole was stirred at rt for 1 h . After evaporation of the solvent under reduced pressure, the residue was column-chromatographed on $\mathrm{SiO}_{2}$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane ( $1: 1, \mathrm{v} / \mathrm{v}$ ) as an eluent to give $\mathbf{3 8}$ ( $56.5 \mathrm{mg}, 98 \%$ ).
2,7-Dibromo-4-hydroxymethyl-4-nitro-1,3,4,5-tetrahydrobenz[cd]indole (41) from $34-\mathrm{KOt}$ - Bu ( $44.5 \mathrm{mg}, 0.4 \mathrm{mmol}$ ) was added to a solution of $\mathbf{3 4}(236.5 \mathrm{mg}, 0.66 \mathrm{mmol})$ in $\mathrm{MeOH}(5 \mathrm{~mL})$ and stirred at rt for 15 min . A solution of $37 \% \mathrm{HCHO}(57.6 \mathrm{mg}, 0.71 \mathrm{mmol})$ was then added and the whole was stirred at rt for 3 h . After addition of sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$, the whole was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on $\mathrm{SiO}_{2}$ with EtOAc-hexane (1:4, v/v) to give $34(68.7 \mathrm{mg}, \mathbf{2 9 \%}$ ) and $\mathbf{4 1}$ ( $153.0 \mathrm{mg}, 60 \%$ ) in the order of elution. 41: mp $165-168^{\circ} \mathrm{C}$ (decomp., pale yellow prisms, recrystallized from $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ ). IR (KBr): 3500, 3370, 3220, 1535, 1522, 1443, $1053 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta: 2.02$ $(1 \mathrm{H}, \mathrm{br}$ s), $3.22(1 \mathrm{H}, \mathrm{d}, J=16.1 \mathrm{~Hz}), 3.36(1 \mathrm{H}, \mathrm{d}, J=16.5 \mathrm{~Hz}), 3.57(1 \mathrm{H}, \mathrm{d}, J=16.1 \mathrm{~Hz}), 3.72(1 \mathrm{H}, \mathrm{d}$,
$J=16.5 \mathrm{~Hz}), 3.92(1 \mathrm{H}, \mathrm{d}, J=12.5 \mathrm{~Hz}), 3.95(1 \mathrm{H}, \mathrm{d}, J=12.5 \mathrm{~Hz}), 7.09(1 \mathrm{H}, \mathrm{d}, J=0.9 \mathrm{~Hz}), 7.31(1 \mathrm{H}, \mathrm{d}, J=0.9$ $\mathrm{Hz}), 7.96(1 \mathrm{H}, \mathrm{br} s)$. MS m/z: 392, 390, $388\left(\mathrm{M}^{+}\right)$. Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{Br}_{2} \mathrm{~N}_{2} \mathrm{O}_{3}: \mathrm{C}, 36.95$; H, 2.58; N , 7.18. Found: C, 37.02 ; H, 2.64; N, 7.18 .

40 from 41 - $\mathrm{Ac}_{2} \mathrm{O}(0.5 \mathrm{~mL})$ was added to a solution of $41(36.1 \mathrm{mg}, 0.09 \mathrm{mmol})$ in pyridine $(1 \mathrm{~mL})$ and the whole was stirred at rt for 3 h . After evaporation of the solvent under reduced pressure, the residue was subjected to p -TLC on $\mathrm{SiO}_{2}$ with $\mathrm{EtOAc}-$ hexane ( $1: 2, \mathrm{v} / \mathrm{v}$ ) as a developing solvent. Extraction of the band having an $R f$ value of $0.72-0.63$ with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ afforded 40 ( $29.6 \mathrm{mg}, 74 \%$ ).
Optical Resolution of ( $\pm$ )-4-Nitro-1,3,4,5-tetrahydrobenz[ $c d]$ indole (6) - Optical resolution of ( $\pm$ )-6 was carried out by HPLC with semi-preparative Chiralpak AS column (Daicel Kagaku ltd.). Thus, 3.0 mL of a solution of $( \pm)-6(141.3 \mathrm{mg}, 0.70 \mathrm{mmol})$ in hexane-isopropanol $(18: 1, \mathrm{v} / \mathrm{v}, 123.0 \mathrm{~mL})$ was injected to the column and hexane-isopropanol ( $18: 1, \mathrm{v} / \mathrm{v}$ ) was used as an eluent employing flow rate 1.0 $\mathrm{mL} / \mathrm{min}$. The eluted optical isomer of $\mathbf{6}$ was detected by UV detector ( 280.0 nm ). Fractions having retention time of 60-67 min gave (+)-6. Fractions having retention time of 67-70 min were a mixture of $(+)-6$ and $(-)-6$, while $(-)-6$ eluted with retention time of $70-78 \mathrm{~min}$. A mixture of $(+)-6$ and $(-)-6$ were separated by repeating the above procedure. Injections and separation of the mixture were repeated over and over again. Finally, (+)-6 ( $61.4 \mathrm{mg}, 44 \%$ ) and ( - )-6 ( $57.2 \mathrm{mg}, 41 \%$ ) were obtained.
Purity of each optical isomer was confirmed utilizing HPLC with Chiralpak AS column for analysis with hexane-isopropanol (18: $1, \mathrm{v} / \mathrm{v}$ ) as an eluent (flow rate $1.5 \mathrm{~mL} / \mathrm{min}$, UV detection 280.0 nm ). (+)-6: mp $126.5-127{ }^{\circ} \mathrm{C}$ (colorless prisms, recrystallized from MeOH). IR (KBr): 3399, 3117, 2960, 1611, 1604, $1530,1441,1418,1372,1361,1345,1281,1220,1080,987,872,840,812,774,753,560,517 \mathrm{~cm}^{-1}$. $[\alpha]^{\mathrm{D}}{ }_{23}+7.12^{\circ}(\mathrm{c}=0.24,99.5 \% \mathrm{EtOH}) .(-)-6: \mathrm{mp} 125-126^{\circ} \mathrm{C}$ (colorless prisms, recrystallized from $\mathrm{MeOH})$. IR (KBr): 3400, 3118, 2965, 1610, 1605, 1531, 1441, 1418, 1372, 1361, 1345, 1281, 1220, 1080, 987, 872, 840, 812, 774, 753, 560, $518 \mathrm{~cm}^{-1} \cdot[\alpha]^{\mathrm{D}}{ }_{23}-7.38^{\circ}(\mathrm{c}=0.25,99.5 \% \mathrm{EtOH}) .{ }^{1} \mathrm{H}-\mathrm{NMR}$ data of $(+)-6$ and $(-)-6$ were identical with that of $( \pm)-6$.
