Kyoko Sato, Yoshikane Iwatsubo and Naohiro Naruhashi : **Distribution pattern of *Taraxacum officinale* (Asteraceae) polyploid forms on Tanegashima Island, Japan**

Graduate School of Science and Engineering, University of Toyama, Gofuku 3190, Toyama 930-8555, Japan

The perennial herb *Taraxacum officinale* Weber is an invasive cosmopolitan species that thrives on the plains and mountains of Japan. Natural hybrids between naturalized triploid *T. officinale* and native diploid *Taraxacum* of the section *Mongolica* have also been reported in Japan (Morita 1988; Watanabe, Maruyama et al. 1997; Watanabe, Ogawa, Naito et al. 1997; Watanabe, Ogawa, Serizawa et al. 1997; Hamaguchi et al. 2000; Yamano et al. 2002; Shibaike and Morita 2002; Shibaike et al. 2005). These hybrid plants are very similar morphologically to *T. officinale*, making it difficult to distinguish between the two types (Watanabe et al. 1997 a; Shibaike and Morita 2002). Because we are unable to distinguish between *T. officinale* and hybrids in the field, we have not attempted to discriminate between *T. officinale* and hybrids in this study, as well as in our previous cytological studies of the common dandelion (Sato et al. 2004, 2007).

The genus *Taraxacum* has a basic chromosome number of $x=8$ (Darlington and Wylie 1955); the *T. officinale* species exists in di-, tri-, tetra-, penta-, and hexaploid forms, as well as in several aneuploid forms (Table 1). In previous surveys, the triploid form was found in many sites throughout Japan (Miyaji 1932; Okabe 1951; Takemoto 1954, 1956, 1961; Sato et al. 2004, 2007), whereas the tetraploid form was restricted to Toyama Prefecture in central Honshu (Sato et al. 2004, 2007). Although *T. officinale* has been extensively studied cytologically, little is known about the distribution of the triploid and tetraploid forms throughout Japan.

In this study, we focused on the distribution pattern of triploid and tetraploid *T. officinale* on

Tanegashima Island, located in the south of Kyushu in southern Japan.

Materials and methods

We collected a total of 56 *T. officinale* plants from 13 sites on Tanegashima Island (Table 2) and cultivated them in plastic pots in the experimental garden of the University of Toyama. Newly formed root tips were collected from the plants and pretreated with a 2.2 mM 8-hydroxyquinoline solution at room temperature for 1 to 1.5 h, then stored at approximately 5°C for 15 h. They were fixed in a mixture of glacial acetic acid and absolute ethyl alcohol (1:3) at room temperature for 1 h, macerated in 1 N hydrochloric acid at 60°C for 10 minutes, and then washed in tap water. Meristems of the root tips were stained in one drop of 1.5% lacto-propionic orcein on a glass slide and a common squash technique was applied to examine the chromosomes. Well-squashed cells were used for chromosome counts.

Results and discussion

Chromosome numbers observed in the present study of *T. officinale* on Tanegashima Island are summarized in Table 2. We found only the triploid ($2n=24$ chromosomes) and the tetraploid ($2n=32$ chromosomes) forms of the plant (Fig. 1). Of 56 specimens examined, 50 plants (89.3%) were of the triploid form, which was found at every site, whereas 6 plants (10.7%) were of the tetraploid form, which was found at only three sites (Fig. 2). These chromosome numbers are consistent with results reported in our previous studies of Japanese *T. officinale* distributed in Toyama Prefecture, central Honshu (Sato et al.

Total		50	6	56

*Site number is in accord with that in Fig. 2.

2007). In this study, the triploid form of *T. officinale* was found at every site examined, whereas the tetraploid form was restricted to sites in the northern part of Tanegashima Island (Fig. 2). In contrast, both triploid and tetraploid forms of *T. officinale* are distributed throughout the plains of Toyama Prefecture (Sato et al. 2007). These distinct distribution patterns suggest that the triploid form was introduced first and spread throughout the entire island the tetraploid plant naturalized in the northern part of Tanegashima Island at a later time.

Triploid *T. officinale* has been reported in many localities throughout Japan, whereas the tetraploid form, along with the triploid form, had been observed only in Toyama Prefecture. In the present study we identify Tanegashima Island as another locality for both triploid and tetraploid forms of *T. officinale*. Since tetraploid plants were found in Toyama Prefecture and Tanegashima Island, there is a possibility that tetraploid plants are distributed between the two regions. Additional cytological studies are clearly necessary to more thoroughly character-

(Received September 20, 2007; accepted October 17, 2007)

佐藤杏子・岩坪美兼・鳴橋直弘：種子島産セイヨウタンポポ（キク科）の染色体数

種子島内 13 カ所より採集したセイヨウタンポポ (*Taraxacum officinale*) 56 個体を対象に染色体数を明らかにした。 $2n=24$ の三倍体と $2n=32$ の四倍体が存在した。56 個体中 50 個体 (89.3%) は $2n=24$ の三倍体セイヨウタンポポであり、採集したすべての場所から見つかったことから種子島全体に分布することが判った。6 個体 (10.7%) は $2n=32$ の四倍体セイヨウタンポポであり、種子島北部（西之表市）の 3 カ所にのみ観察された。わが国では四倍体セイヨウタンポポは富山県から報告されている (Sato et al. 2004, 2007)。今回の研究により種子島にも分布することが判明したことから、四倍体セイヨウタンポポは富山と種子島の間の地域にも分布している可能性がある。
