## Abstract

Single crystal (NMt<sub>4</sub>)(NEt<sub>4</sub>)CoCl<sub>4</sub> and (NMt<sub>4</sub>)(NEt<sub>4</sub>)CoBr<sub>4</sub> were grown by slow evaporation method and dielectric constant have been measured over a temperature range from -190°C to 50°C. Two phase transition points, -165°C and -171°C, have been observed for (NMt<sub>4</sub>)(NEt<sub>4</sub>)CoCl<sub>4</sub> crystal. For (NMt<sub>4</sub>)(NEt<sub>4</sub>)CoBr<sub>4</sub> crystal, two phase transition points, -163°C and -178°C, were also observed and moreover found that this temperature region were ferroelectric phase.

## § Introduction

The crystal of tetramethylammonium (hereafter the fomula N(CH<sub>3</sub>)<sub>4</sub> is abbreviated as NMt<sub>4</sub>) tetrachlorocobaltate (NMt<sub>4</sub>)<sub>2</sub>CoCl<sub>4</sub> undergoes successive phase transition at about -151, -81, 3.0, 4.6, 7.1 and 20°C on heating and shows the ferroelectricity in temperature range between 4.6°C and 7.1°C.<sup>1)~3)</sup> These phase are denoted as I, II, III, II', IV, V, VI in the order of decreasing temperature. The structure of these phase are as follow, phase I is *Pnmc*, phase II and II' are incommensurate, phase III shows commensurate accompanied with ferroelectricity along *a* axis and space group is P2<sub>1</sub>cn, phase IV shows commensurate (space group P112/n), phase V is P12<sub>1</sub>/c1 and phase VI is orthorhombic with space group P2<sub>1</sub>2<sub>1</sub>2<sub>1</sub>.

On the other hand, the crystal of tetraethylammonium (hereafter the fomura N(C<sub>2</sub>H<sub>5</sub>)<sub>4</sub> is abbreviated as NEt<sub>4</sub>) tetrachlorocobaltate (NEt<sub>4</sub>)CoCl<sub>4</sub> undergoes phase transition at about -53°C.<sup>4)</sup> The phases are denoted as I, II in order of decreasing temperature. Space group of phase I is P4<sub>2</sub>/nmc.

The crystal of (NMt<sub>4</sub>)<sub>2</sub>CoBr<sub>4</sub> undergoes phase transition at about 14.7°C and two phases are denoted as I (space group *Pnmc*) and II (space group P12<sub>1</sub>/c1).<sup>5)~7)</sup> The crystal of (NEt<sub>4</sub>)<sub>2</sub>CoBr<sub>4</sub> undergoes phase transition at about 9°C and two phases are denoted as phase I (space group P4<sub>2</sub>/nmc) and II. (NMt<sub>4</sub>)CoCl<sub>4</sub> crystal have successive phase transition but (NMt<sub>4</sub>)CoBr<sub>4</sub>

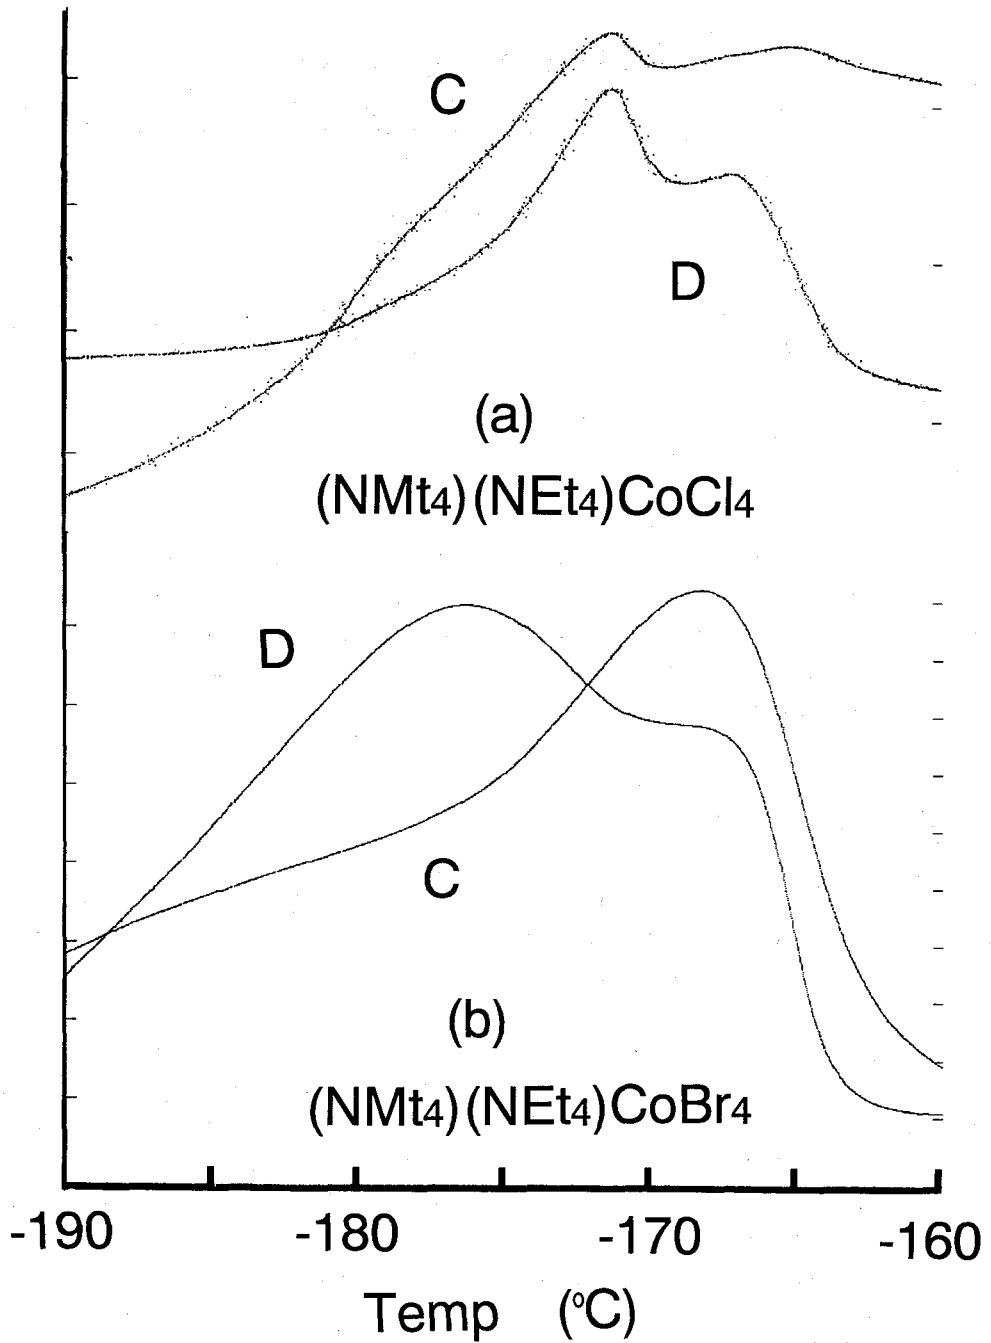

Fig. 1 Capacitance C and dielectric loss D (a) for  $(\text{NMt}_4)(\text{NEt}_4)\text{CoCl}_4$  crystal, and (b) for  $(\text{NMt}_4)(\text{NEt}_4)\text{CoBr}_4$  crystal, respectively.

has one simple second order phase transition,  $(\text{NEt}_4)_2\text{CoCl}_4$  and  $(\text{NEt}_4)_2\text{CoBr}_4$  have one simple first order phase transition.<sup>8)</sup>

A study of  $(\text{NMt}_4)(\text{NEt}_4)\text{CoX}_4$  mixed crystal system seems, therefore, to be particular

interest. In this paper, we report the dielectric properties of  $(\text{NMt}_4)(\text{NEt}_4)\text{CoCl}_4$  and  $(\text{NMt}_4)(\text{NEt}_4)\text{CoBr}_4$ .

## §. 1 Experimental

Single crystal  $(\text{NMt}_4)(\text{NEt}_4)\text{CoCl}_4$  was prepared from aqueous solution by slow evaporation method at 30°C. At first, the crystal of  $(\text{NMt}_4)_2\text{CoCl}_4$  was obtained from stoichiometric proportion of  $\text{N}(\text{CH}_3)_4\text{Cl}$  and  $\text{CoCl}_2$ , and  $(\text{NEt}_4)\text{CoCl}_4$  was also obtained from  $\text{N}(\text{C}_2\text{H}_5)_4\text{Cl}$  and  $\text{CoCl}_2$ . These crystals were reduced to powder, and mixed in stoichiometric proportion.

Single crystal of  $(\text{NMt}_4)(\text{NEt}_4)\text{CoBr}_4$  was grown as similar way to  $(\text{NMt}_4)(\text{NEt}_4)\text{CoCl}_4$ .

The crystals for dielectric measurement were polished with wet filter paper which was soaked with methanol and water. Typical size of specimens were about 0.05cm in thickness and 1 cm<sup>2</sup> in area. Ag paste was used as electrodes. Dielectric constant and loss were measured with LCR meter, YHP-4285A, at a constant frequency 1.00 MHz, which was controlled by computer (NEC PC-9801DA) over a temperature range from -190°C to 50°C. Typical changing rate of temperature during the measurement was about 19k/hour. The 60 Hz D-E hysteresis loop was observed by Sawyer-Tower circuit.

## §. 2 Results and Discussion

Typical results of capacitance  $C$  and dielectric loss  $D$  for (100) plate of  $(\text{NMt}_4)(\text{NEt}_4)\text{CoCl}_4$  and  $(\text{NMt}_4)(\text{NEt}_4)\text{CoBr}_4$  crystals were shown in Fig. 1. In  $(\text{NMt}_4)(\text{NEt}_4)\text{CoBr}_4$  crystal, two transition points were found, one was about  $-163^\circ\text{C}$  and another was  $-178^\circ\text{C}$ . In this temperature region, D-E hysteresis loop was observed as shown in Fig. 2. This result shows that the temperature region between  $-163^\circ\text{C}$  to  $-178^\circ\text{C}$  in  $(\text{NMt}_4)(\text{NEt}_4)\text{CoBr}_4$  crystal is ferroelectric phase. For  $(\text{NMt}_4)(\text{NEt}_4)\text{CoCl}_4$  crystal, however, D-E hysteresis loop was not observed in the temperature region from  $-165^\circ\text{C}$  to  $-171^\circ\text{C}$ . The phase diagram of  $(\text{NMt}_4)(\text{NEt}_4)\text{CoCl}_4$  and  $(\text{NMt}_4)(\text{NEt}_4)\text{CoBr}_4$  were shown in Table 1.
